INTRODUCTION

This rapid biodiversity assessment of KGBSR is based on review of previous biodiversity studies conducted by many authors and our field study during 26 July to 20 August 2009 in Phu Quoc NP, U Minh Thuong NP, An Bien – An Minh Protection Forest and Hon Dat – Kien Ha Special Use and Protection Forest (Kien Luong, Kien Hai)

This assessment was planned and funded by GTZ Project/ Conservation and Development of Kien Giang Biosphere Reserve. The assessment team includes 4 scientists from Institute of Ecology and Biological Resources and one scientist from Hanoi Education University. The team leader is Ass. Prof. Dr. Nguyen Xuan Dang from Institute of Ecology and Biological Resources

The assessment Team would like to express its sincere thank to GTZ/Project for funding this study, all staff members of GTZ/Project Management board; all staff members of Phu Quoc NP, U Minh Thuong NP, An Bien – An Minh Protection Forests and Hon Dat – Kien Ha Special Use Forest and Protection Forest for their valuable help for our survey.

For all questions related to content of this report please contact Ass. Prof. Dr. Nguyen Xuan Dang directly or through phones (office: 0437562810, Mol. 0913312431) or e-mail:

dangnx@fpt.vn

EXECUTIVE SUMMARY

This rapid biodiversity assessment of KGBSR is based on review of previous biodiversity studies conducted by many authors and findings of our field study during 26 July to 20 August 2009 in Phu Quoc NP, UMT NP, AB – AM Protection Forest and Hon Dat – Kien Ha Special Use and Protection Forest (Kien Luong, Kien Hai)

The assessment results show that, in spite of in-sufficient investigation, KGBSR appears to have very high biodiversity potential. Until now, it was recorded in KGBSR:

- 6 main ecosystems with 22 different habitat types
- About 1,500 species of vascular plants belonging to 150 families, 70 orders
- 77 species of mammals belonging to 20 families, 8 orders
- 222 species of birds belonging to 50 families, 11 orders
- 107 species of reptiles and amphibians belonging to 20 families, 5 orders

Within it:

- Phu Quoc area has: 5 main forest types; 1,172 species of high vascular plants belonging to 562 genera, 137 families, 66 orders, 6 branches; 61 species of mammals belonging to 18 families, 7 orders; 134 species of birds belonging to 37 families, 11 orders; 23 species of amphibians and 55 species of reptiles.
- UMT-AB-AM area has: 3 main forest types; 387 species of high vascular plants belonging to 108 families, 31 species of mammals belonging to 13 families, 8 orders; 152 species of birds belonging to 38 families, 10 orders; 7 species of amphibians and 38 species of reptiles.
- Kien Luong – Kien Hai area has: 3 main forest types; 867 species of high vascular plants belonging to 157 families; 28 species of mammals belonging to 15 families, 8 orders; 95 species of birds belonging to 37 families, 10 orders; 13 species of amphibians and 85 species of reptiles.

Out of recorded species, 30 plant species, 20 mammal species, 19 bird species, 1 amphibian species and 26 reptile species are of conservation priority (threatened with extinction in Vietnam and/or in the World), namely:

- Phu Quoc area has 25 plant species, 14 mammal species, 5 bird species and 23 reptile species
- UMT-AB-AM area has 1 plant species, 11 mammal species, 15 bird species and 20 reptile species
- Kien Luong – Kien Hai area has 21 plant species, 6 mammal species, 3 bird species, 1 amphibian species and 19 reptile species

Four (4) forest types and/or plant communities are of special conservation priority:

1. Dwarf forest on sand hills in Phu Quoc NP
2. Stand of *Lumnitzera littorea* in Rach Tram estuary, Phu Quoc NP.
3. Natural *Melaleuca* forest on pitland in UMT NP
4. Coastal mangrove forest

There are 20 species identified as of special conservation priority including Roundleaf Cycad *Cycas litoralis*; Hairy-nosed Otter *Lutra sumatrana*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Indochinese Silver Langur *Trachypithecus germaini*, Lylei's Fruit Bat *Pteropus lylei*, Large Flying Fox *Pteropus vampyrus*; Sarus Crane *Grus antigone*,

Indian Darter *Anhinga melanogaster*, Lesser Adjutant *Leptoptilos javanicus*, Great Hornbill *Buceros bicornis*; Reticulated Python *Python reticulatus*, King Cobra *Ophiophagus hannah*, Yellow-headed Temple Turtle *Heosemys annandalii*, Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*; Green Sea Turtle *Chelonia mydas* and Hawksbill Sea Turtle *Eresmochelys imbricata*.

Main forest management problems and threats to biodiversity are:

- Maintaining of high water level for forest fire prevention is causing negative impact on growth and development of *Melaleuca* forest.
- Conversion of forestry land with rare vegetation types in Phu Quoc NP into land for tourism infrastructure construction,...
- The existing of system of dykes surrounding household forest is disturbing dispersal and natural regeneration of coastal mangrove forests
- Existing encroachment/ destruction of coastal protection forest for aquaculture.
- Widespread wildlife hunting and trade
- Human encroachment and disturbance of wildlife habitat
- Environment pollution due to subsistence and industrial wastes, use of pesticides and herbicides
- Impacts of economic and tourism development leading to reduction of forest area and habitat degradation.
- Local community has low awareness on biodiversity conservation.
- Ineffectiveness of forest and wildlife management in the area

Based on the biodiversity assessment, following recommendations are made:

I. Additional biodiversity surveys for KGBSR

1. Additional biodiversity assessment of Hon Chong NR and coastal islands in Kien Luong – Kien Hai (2010)

Kien Luong – Kien Hai area represents a unique landscape. Tropical broadleaf forests in Hon Chong Semi-island (and also small islands) contain high biodiversity potential, but still poorly investigated. Many species new for science were discovered during recent years. This area is facing with increasing negative impacts from industrial development (Cement factory, future thermo-electricity factory, future sea port development, etc.) and tourism development. The biodiversity values of this area should be properly assessed for relevant conservation measures

2. Survey for assessing population status of species conservation priority species (2010-2011).

Additional surveys are necessary to identify population status of highly endangered species such as Indochinese Silver Langur *Trachypithecus germaini*, Long-Tailed Macaque *Macaca fascicularis*, Slow Loris *Nycticebus coucang*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Hairy-nosed Otter *Lutra sumatrana*, Small-clawed Otter *Aonyx cinerea*, Sarus Crane *Grus antigone*, Indian Darter *Anhinga melanogaster*, Lesser Adjutant *Leptoptilos javanicus* Yellow-headed Temple Turtle *Heosemys annandalii*, Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*, Green Sea Turtle *Chelonia mydas*, and Hawksbill Sea Turtle *Eresmochelys imbricata* and also Lyle's Fruit Bat *Pteropus lylei*, Large Flying

Fox *Pteropus vampyrus* in Phu Quoc NP, UMT NP, Hon Chong NR. These animal are strongly facing with various negative impacts (hunting, habitat degradation, infrastructural development, etc.)

To study stand of *Lumnitzera littorea* in Rach Tram estuary of Phu Quoc NP to identify its regeneration capacity and ecological requirement for applying relevant conservation measures.

3. Survey of wildlife trade in KGBSR area (2010)

To carry out a survey of wildlife hunting, trade and wildlife keeping in area of Phu Quoc NP, UMT NP, Hon Chong NR (Kien Luong District) to identify scale, network, dynamic of wildlife trade, participating people, importance of wildlife trade for livelihood of poor families, etc. in order to develop relevant measures for its control

4. Study of restoration and sustainable development of Melaleuca forests (2010-2012).

Study is necessary to identify environmental conditions for natural regeneration of *Melaleuca* forest and develop technical guidance for natural regeneration of *Melaleuca* forest in UMT NR, forest compartment 2 of AB-AM Protection Forest.

To assess impacts of long-term retaining of high water level for fire prevention on growth and development of *Melaleuca* forests in UMT NP and forest compartments 1 and 3 of AB-AM Protection Forest in order to determine relevant hydrological regime that can help to minimize risk of forest fire meanwhile support the normal development of *Melaleuca* forest

5. Study of disposal capacity and natural sea-encroachment capacity of mangrove forests (2011- 2013)

System of dykes for aquaculture and harvesting natural sea products is disturbing the natural dispersal and natural regeneration of mangrove forest trees (*Rhizophora spp*; *Bruguiera spp*; *Avicennia spp.*; *Aegiceras sp.* ; *Sonneratia spp.*) that reduce sea-encroachment and environmental protection function of the forest. Study of dispersal capacity, natural regeneration capacity of forest will help to find the measures for less expensive development of coastal mangrove forests that reflects natural forest processes/succession.

6. Investigation for developing vegetation map, soil map and hydrological map of UMT NP (2010-2011)

These maps together with companying data set will be an important scientific database for development of relevant management measures and monitoring of change in vegetation cover of UMT NP.

7. Environmental impact assessment of development projects inside and in vicinity of KGBSR (since 2010).

To conduct environmental impact assessment of Starbay Tourism Landscape Project (542.79 ha) and another proposed tourism project in Phu Quoc NP for reviewing these projects to meet biodiversity conservation purposes in this area .

To conduct environmental impact assessment of development projects in Kien Luong district close to Hon Chong NR and Kien Luong-Kien Hai Protection Forest such as Thermo-electric factory construction, Cement factory construction, new harbor construction and tourism development for mitigation measures

To conduct environmental impact assessment of aquaculture system inside protection forest to find measures for mitigating negative impacts and ensuring sustainable development in the area.

II. Biodiversity monitoring and evaluation programme

1. Monitoring of populations of high conservation priority species (since 2010).

Population status of following highly endangered species should be monitored for relevant conservation measures: Indochinese Silver Langur *Trachypithecus germaini*, Long-Tailed Macaque *Macaca fascicularis*, Slow loris *Nycticebus coucang*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Hairy-nosed Otter *Lutra sumatrana*, Small-clawed Otter *Aonyx cinerea*, Sarus Crane *Grus antigone*, Lesser Adjutant *Leptoptilos javanicus*, Indian Darter *Anhinga melanogaster*, Yellow-headed Temple Turtle *Heosemys annandalii*, Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*, Green Sea Turtle *Chelonia mydas*, and Hawksbill Sea Turtle *Eretmochelys imbricata* in Phu Quoc NP, UMT NP and Hon Chong NR and also populations of Lylei's Fruit Bat *Pteropus lylei*, Large Flying Fox *Pteropus vampyrus* in Phu Quoc NP and UMT NP.

2. Monitoring forest area reduction due to negative impacts of human activities (since 2010)

Coastal Protection forests represent as narrow band along sea coast and always face with forest encroachment/destruction by aquaculture and other human activities, therefore, long-term monitoring programme must be set up in critical areas for monitoring the change and apply relevant mitigation measures. Remote sensing techniques (satellite images) should applied for large-scale forest area monitoring.

3. Monitoring factors that cause degradation of environment quality and wildlife habitats (since 2010).

Negative impacts on environment and habitats are caused by tourism development, pollution by subsistence wastes, industrial wastes, use of pesticides, herbicides, rodent poisonous baits, etc. These impacts should be monitored to undertake relevant prevention and mitigation measures.

III. Protection programme

1. Capacity building for Management Boards of Nature Reserves and Protection Forests (2010 – 2012)

Conducting various training courses for staff members of the forest management boards to increase their knowledge on biodiversity conservation, techniques of biodiversity monitoring and evaluation, their skill of key species identification, observation, recording and reporting, etc.

Conducting training courses to increase their knowledge and enforcement skill of national legislation on forest protection and wildlife conservation

Constructing additional guard posts in Hon Chong NR and Kien Luong – Kien Hai Protection forest to improve effectiveness of the forest protection.

Providing the forest management boards with equipments for forest patrol, law enforcement and forest fire prevention such as motorcycles, motorboats, car, GPS, binocular, etc.)

2. Intensification of forest patrolling and law enforcement (since 2010)

Intensification of forest patrolling and law enforcement to control:

- illegal forest encroachment/destruction
- wildlife hunting, trade and consumption in the area
- wildlife keeping and husbandry in the area to prevent catching animals from the wild for captive breeding stock as well as smuggling wild-caught animals under the guide of captive breeding of animals

3. Installing system of signboards with notification about boundaries and management regulations of KGBSR (2010).

Signboards notifying KGBSR boundary and management regulations are necessary to keep local people and visitors (tourists) aware and obey management regulations of KGBSR in term of nature protection, forest protection and wildlife conservation.

*4. Conservation of stand of *Lumnitzera littorea* and unique vegetation type "Dwarf forest on sand hills" in Phu Quoc NP (since 2010)*

Plant species *Lumnitzera littorea* is classified as VU-vulnerable in RDB VN (2007) and stand of *Lumnitzera littorea* in Phu Quoc NP is the only largest population of this species in Vietnam. It must be strictly protected for its long-term survival.

"Dwarf forest on sand hills" in Phu Quoc NP (located from Ganh Giau Guard Post to Bai Can Guard Post) is very rare vegetation type in Vietnam. This vegetation type has long history of adaptation to high salinity, acid and inundation. These vegetation type usually has small size and therefore highly sensitive to human affect. It will not be recovered if undergoing destruction impacts.

5. Development of community-based forest management model (since 2011)

Establishment of community-based forest management model is important to reduce pressure on biodiversity and improvement of livelihood of local communities. Objectives of this models include:

- Participatory reforestation, forest protection and enrichment of existing forests for sea wave prevention, environment protection and biodiversity conservation.
- Developing and applying system of sustainable use of forest resources and forest land by local community
- Increase forest products from Production forests including timbers, fuelwood, livestock food and other non-timber forest products to increase household income of local communities.

- Involvement of local households into planning and management of forest products.

IV. Conservation education and improvement of livelihood of local communities

1. Conducting educational programme to increase awareness of local communities on nature protection and biodiversity conservation (since 2010).

Some key activities are:

- Producing brochure about KGBSR
- Producing manuals for education on forest protection and biodiversity conservation and conducting training courses for local communities and schools.
- Producing and distributing posters, leaflet with messages on nature protection and biodiversity conservation.
- Conducting educational programmes by public media such as newspapers, radio and TV broadcasting, etc.

2. Conducting programmes that help to improve livelihood of local communities, involve local community into forest management activities so that they can receive certain direct benefits from forests; introducing alternative materials for forest products to reduce pressure on local forests (since 2010).

Following activities can be carried:

- Providing local community with credit for production development, introducing advanced technologies for increasing productivity of agricultivation, animal husbandry, development of traditional industries or applying new industries to create new job and new income sources for local communities.
- Conducting forest allocation for protection to local communities
- Introducing alternative materials for timber, fuelwood and other non-timber forest products.
- Contracting local people for forest growing and forest protection
- Involving local communities into tourism services that will create additional household income

CHAPTER 1. OBJECTIVES, STUDY SITES, TIME SCHEDULE AND ASSESSMENT METHODS

1.1. ASSESSMENT OBJECTIVES

As requested by GTZ/Project, objectives of this study are as following:

- Reviewing available literature about biodiversity assessment in KGBSR to identify biodiversity values of KGBSR and information gaps or out-of-date which need to be filled up and updated
- Conducting rapid field survey in biodiversity-rich areas of KGBSR to collect additional and updated information about status of vegetation, flora and terrestrial vertebrate wildlife with focus on species and areas with high biodiversity significance
- Identifying pressure and threats to biodiversity in general and taxa of high conservation significances in particular.
- Developing recommendations about conservation measures and biodiversity monitoring in KGBSR in coming years.

Due to short survey duration, this biodiversity assessment is based mainly on review of previous survey reports of many other researchers (see Reference for details) and of this team members (Nguyen Xuan Dang, Ngo Xuan Tuong, Pham Duc Tien). Field survey was focused on assessment of population status of high conservation priority species and identification of biodiversity conservation problems in the area.

1.2. SURVEY TIME SCHEDULE AND SITES

The field survey was conducted from 27 July to 16 August 2009 in 4 following sites (Figure 1; Annex 1):

- 27 – 31 July 2009: Surveyed in Phu Quoc area (Suoi Cai, Bai Thom, Suoi Can, Rach Tram, Xom Chai, Ganh Dau, Da Chong, Duong Dong, Vo Quap- Nui Chua mountain, Ham Ninh, etc.)
- 2 - 5 August 2009: Surveyed in AB-AM Protection Forest (Thu Bay village, An Dong Village of Nam Thai A Commune; Van Khanh, Can Gao village, Dong Hung B, Kinh Nam village, Kinh Muoi village etc.)
- 6 – 10 August 2009: Survey in UMT NP (Hoa Mai lake, Van Khanh, Kinh 21, Minh Thuan Market, etc.)
- 11 – 16 August 2009: Surveyed in Kien Luong – Kien Hai Forests (Binh An, Binh Tri, Mo So, Chua Hang, Ba Hon, Binh An Lake, Hon Chong NR, coastal mangrove forests, Ha Tien)

Assessment Team consists of 4 scientists from IEBR (Hanoi) and one scientist from Hanoi Education Institute (Annex 1). Team leader is Ass. Prof. Dr. Nguyen Xuan Dang from IEBR (Hanoi)

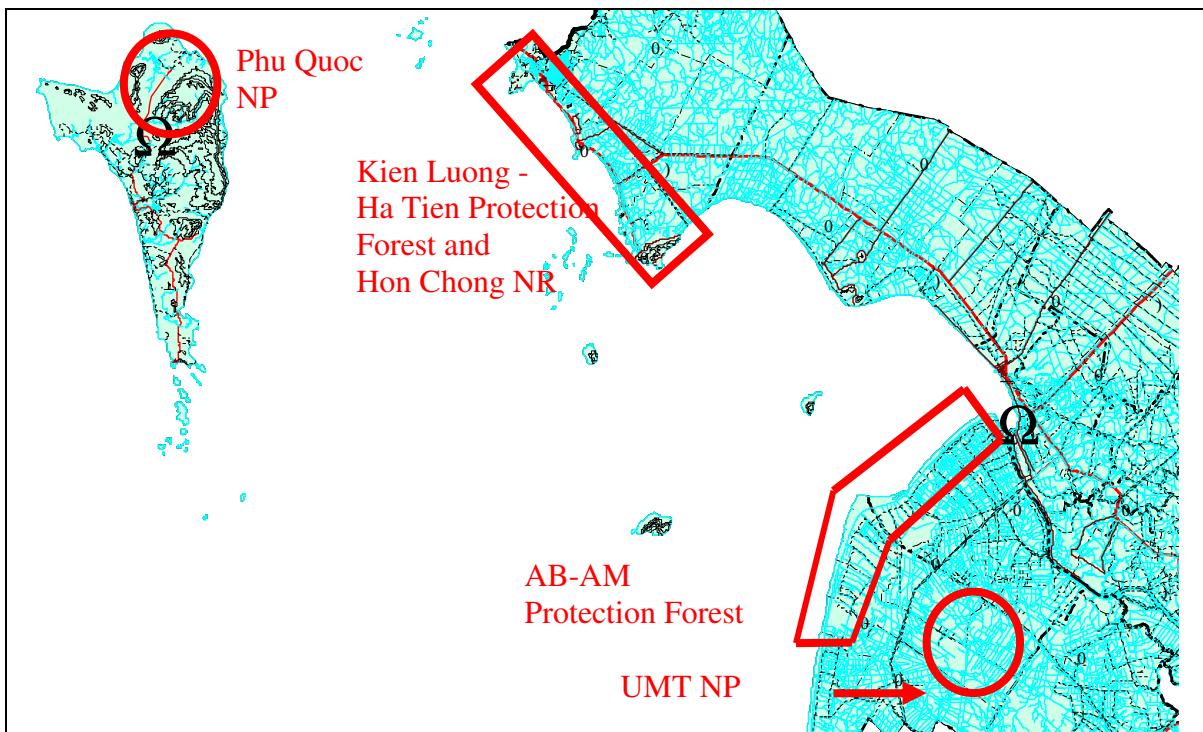

Figure 1. Location of survey sites in KGBSR

1.3. ASSESSMENT METHODS

1.3.1. Review of reports from previous surveys

Literature review is an important part of this assessment. We try to collect as much as possible publications and un-published reports from previous surveys. Totally, more than 40 literature sources (see Reference for details) have been collected and reviewed for this assessment.

1.3.2. Field survey methods

a) *Methods for vegetation and flora survey*

As a large area needing to be covered in a short time, following rapid assessment techniques were used:

- *Preparation for field study*

Before field study we revised all publications and reports related to vegetation, flora, terrain, geological, hydrological, tourism and socioeconomic features of survey area to determine where and what should be focused on.

- *Interviewing local forest management staff members*

In each surveyed sites, we firstly interviewed technical officers and other staff members of the forest management board about biodiversity related questions to get

preliminary information and to identify relevant places for field work, then we asked them to nominate good technical staff members and rangers to joint our survey. During 1-2 first days we made overview survey of the area to find out overall features of local vegetation and flora and during other days we conducted detailed study of vegetation structure and floral inventory.

- *Standard quadrat techniques*

Some standard quadrates were established to get better description of forest structure (layers, canopy coverage, floral composition, etc.). All statistic data were recorded in pre-prepared forms. Taxonomic identification was restricted to family level, only few common species were identified upto species level. The size of standard quadrat is 10x20m. In each quadrat, measurements were taken to all trees of more than 5cm in diameter. The height of trees was estimated using stick of 4-5m. Circumference of trees was measured by band measurer. Due to low number of quadrat conducted, the collected data just used for preliminary assessment.

b) Methods of mammal survey

- *Interviewing staff members of forest management boards and local residents*

The interviews were made to get general information about status of mammal fauna in study area, abundance of key species, extant species and status of wildlife hunting, use and trade. Interviewees are persons who have good knowledge about local fauna (former hunters, wildlife traders, etc.). Interviewees were asked to show all evidences of wild animals they have such as animal parts or live animals kept for pets in the village. Colour pictures of wildlife were used to support taxonomic identification.

- *Field transect survey*

Various survey transects/ routes crossing through various habitat types were used for searching direct animal sightings or their signs (tracks, dropping, vocalizations, dens, etc.). The survey was conducted mainly in daytime, normally from 6:30 – 12:00 and from 13:00 to 17:00. Several night surveys were also made to get sightings of nocturnal animals.

- *Live-trapping small mammals*

Fifty five (55) live box traps were used to catch small mammals (rodents, insectivores) and 8 mist-nets of total 64 m long were used to catch bats. All caught animals were measured (headbody length, hind foot length, tail length, body weight etc.), taxonomically identified and then released back at the same place.

- *Taxonomic identification*

Mammal taxonomic identification was based on following manuals Lekagul et al., (1988), Bate et al., (1997), Borissenko et al., (2003), Smith et al. (2008) và Fancis (2008). Scientific names and systematic order follow Wilson and Reeder (2005) with some updated review. Vietnamese names followed Nguyễn Xuân Đặng and Lê Xuân Cảnh 2009.

c) Methods of bird survey

- *Interviewing local residents*

Some bird species can be identified through interviewing local residents and local rangers. During interview, color photographs of living birds in field guide books are used to help taxonomic verification. Bird parts (feathers, bills, feets, etc.) remained in villages are also examined for supporting information.

- *Transect survey*

Using motorboats and walking routes to conduct various transect surveys through different habitat types of each survey areas. Birds were observed by naked eyes and binoculars and also recognized through their specific vocalizations.

- *Taxonomic identification*

Taxonomic identification of birds was based on field guide books with color pictures of birds by Craig Robson (2005); and also book "Birds of Vietnam" of Nguyen Cu et al.(2000). Vietnamese names and scientific names of birds followed Vo Quy and Nguyen Cu (1995) and Charles G. Sibley and Burt L. Monroe, Jr., 1990.

d) Methods of reptile and amphibian survey

- *Interviewing local residents*

Interviewees were selected as persons who often go to the forest, former hunters and wildlife traders. This method is useful for common and large-size species. We also visited some wildlife trade shops for examining animal collection and interviewing local traders

- *Transect survey and collecting specimens*

Transect survey was conducted using motorboats, motorcycles and walking to get direct animal sighting and their signs observation. Specimens were collected by naked hands, hand nets, pitpond traps, night spotting etc. Collected living specimens were released back to the field after getting taxonomic identifications.

- *Taxonomic identification*

Taxonomic identification was based on several guide books such as Serpents de l' Indochine. Bourret R., 1936 - Les Serpents du Laos. Deuve J., 1970; A Field Guide to the Snakes of South Vietnam Simm. Campden - Main, 1970; Les Serpents du Cambodge. Saint Girons H., 1972. Systematic sequence, Vietnamese names and scientific names followed Nguyen Van Sang et al 2005 and Nguyen Van Sang et al., 2008.

1.3.3. Workshop for evaluation of preliminary report and recommendations for final report

Just after completion of field survey, Project Office has organized a workshop in Rach Gia City for evaluation of preliminary results and recommendations for final report. Attended the workshop are Project Director, CTA and other staff members of Project Offices; representatives of all National parks, Nature reserves and Protection forests where surveys were taken place; Director of Sub-Institute of Forestry Science in South; representatives of several organizations of Kien Giang Province. At the workshop, except for copies of preliminary report (30 pages) delivered to each

workshop participants, survey team made 5 PowerPoint presentations with picture illustration to enable participants better understand of the assessment results.

At the workshop, many questions, discussions and recommendations were made to correct information and enable final report to reach better quality. Generally, participants highly appreciated assessment results, especially its recommendations for follow-up actions. Survey Team welcomes all questions and recommendations from workshop participants. In this final report, we try to satisfy all recommendations about improving the assessment report.

CHAPTER 2. LITERATURE REVIEW OF BIODIVERSITY VALUES OF KIEN GIANG BIOSPHERE RESERVE

2.1. LOCATION AND PLANNING OF KGBSR

In 2007, UNESCO officially recognized KGBSR as a world biosphere reserve. According to Proposal document submitted by Kien Giang People Committee and Vietnam MAB Office (2005), KGBSR is situated in territory of 5 districts (Phu Quoc, An Minh, Vinh Thuan, Kien Luong and Kien Hai) of Kien Giang Province. KGBSR is an area of wetlands, coastal forests and islands. The area has elevation ranging from 0.6 to 490 m asl. Total area is 1,118,105 ha, of which 329,304 ha in mainland and 858,801ha in the sea. Geographically, KGBSR is divided into 3 areas:

- Phu Quoc area (304,933 ha) including Phu Quoc NP on Northern Phu Quoc Island and adjacent forests in Ham Rong, Ganh Dau and Ham Ninh areas.
- UMT-AB-AM area (148,758 ha), including UMT NP, its buffer zone and AB-AM Protection Forests.
- Kien Luong – Kien Hai area (734,415 ha) including coastal Protection forests in Kien Luong and Kien Hai Districts and Hon Chong NR (Kien Luong District).

KGBSR is divided into 3 functional zones: Core zone (36,935ha), Buffer Zone (172,578 ha) and Transition zone (978,591 ha) (Table 1).

Table 1. Zonation of Kien Giang Biosphere Reserve

Zone	Mainland (ha)	Sea (ha)	Total (ha)
1. Core zone	23,073	13,836	36,935
- Phu Quoc NP	12,037	13,862	25,899
- UMT NP	8,111	0	8,111
- Kien Luong -Kien Hai Protection Forest and Nature Reserve	2,926	0	2,926
2. Buffer zone	116,791	55,787	172,587
3. Transition zone	189,439	789,152	978,591
Total:	329,304	858,801	1,118,105

Source: People Committee of Kien Giang Province and Vietnam MAB Committee (2005)

Functions of KGBSR are:

- To protect landscape; conserve diversity of ecosystems, species, gene pool and culture
- To promote sustainable development of economy and human resource in term of ecology and social culture
- To support projects on environmental education, biodiversity research and monitoring and sustainable development

2.2. STATUS OF BIODIVERSITY STUDY IN KGBSR

Biodiversity of KGBSR have been studied by several organizations and agencies such as Southern Sub-FIPI and Sub-FIPI II (in Ho Chi Minh City), IEBR (Hanoi),

Institute of Tropical Biology (in Ho Chi Minh City), Forest Science Institute of Vietnam (in Hanoi), Southern Sub-Institute of Forestry Science, National University of Ho Chi Minh City, Can Tho University, Vietnam-Russian Tropical Centre, several NGOs (Care International in Vietnam, Birdlife International – Indochina Programme, Wildlife at Risk), etc.

2.2.1. Phu Quoc area

Before 2000, some scientists conducted fauna and floral studies in Phu Quoc Island (Van Peenen et al., 1969; Pham Hoang Ho, 1985; Đang Huy Huynh et al., 1994;...). However, the information from these studies was preliminary and out of date.

In 2000, Sub-FIPI II conducted overall assessment for establishment of "Investment Plan for Development of Phu Quoc NP and Buffer zone, Phu Quoc District, Kien Giang Province, Period 2001-2005 (Sub-FiPI, 2001). This was the first overall assessment of biodiversity values of Phu Quoc area. This study provides first description of vegetation types and a list of 497 species of vascular plants belonging to 112 families, 360 genera and 150 species terrestrial vertebrate animals belonging to 69 families (Mammals: 26 species, 12 families; birds: 84 species, 34 families; reptiles: 29 species, 14 families and amphibians: 11 species, 4 families).

In 2003, Vietnam-Russian Tropical Centre conducted a survey on fauna of Phu Quoc NP, however, only few findings were published (Abramov et al. 2007, Abramov et al. 2008).

In 2002-2005, Sub-FIPI II together with IEBR conducted biodiversity surveys in Phu Quoc NP. By these surveys, Sub-FIPI compiled a list 1,164 species of vascular plants belonging to 137 families, 66 orders (Sub-FIPI II, 2003); IEBR recorded 202 species of terrestrial vertebrates belonging to 75 families, 26 orders (Mammals: 22 species, 14 families, 6 orders; birds: 119 species, 41 families, 16 orders; Reptiles: 47 species, 10 families, 3 orders; amphibians: 14 species, 4 families, 1 order) (Le Xuan Canh et al., 2005; Nguyen Xuan Dang et al., 2007, etc.). In comparison with previous lists, this study significantly increased number of recorded species, except mammals which reduced from 26 species to 22 species (due to some species were in-correctly recorded in previous study).

Recent years, WAR has conducted a number of wildlife surveys in Phu Quoc NP, however, the results have not published yet.

2.2.2. U Minh Thuong – An Bien – An Minh area

In 1991, FPD of Kien Giang conducted rapid survey for developing "Investment Plan for U Minh Thuong Nature Reserve and Historical Site" (People Committee of Kien Giang Province, 1992). This document reported 32 plant species and 144 animal species (19 species of mammals, 80 species of birds, 34 species of reptile and 11 species of amphibians)

During period of 2000-2003, CARE Project/ Community Development and Protection of U Minh Thuong NR" organized a series of basic biodiversity assessment of UMT NP. These studies provided an important database on biodiversity of UMT NP. The

assessment results were provided in the Project technical reports and book "Biodiversity of U Minh Thuong NP – Vietnam" (Nguyen Xuan Dang et al. 2004). According to latest document, in UMT NP, it was recorded 243 plant species of 84 families; 32 mammal species of 12 families, 8 orders; 151 bird species of 38 families; 34 reptile species of 10 families, 2 orders; 7 amphibian species of 3 families, 1 order; 34 fish species of 17 families, 7 orders; 181 insect species of 60 families, 11 orders. Part of these data was published in Journals and workshop proceedings (Tran Triet 2000, 2001; Nguyen Xuan Dang et al., 2000 to 2004; Nguyen Phuc Bao Hoa, 2002, etc.)

In 2001, Sub-FIPI II conducted survey for establishment of "Investment Plan for Development of U Minh Thuong NP and Buffer zones, Period 2002-2006" (Sub-FIPI II, 2001). However, a big forest fire happened in UMT NP, in March 2002, destroying large area of primary natural *Melaleuca* forest. After the fire, Sub-FIPI II, IEBR, Institute of Tropical Biology, Southern Sub-Institute of Forest Science, Department of Science, Technology and Environment of Kien Giang Province, DARD of Kien Giang Province, CARE International in Vietnam and some other organizations conducted re-assessment of biological resources of UMT NP. Based on these re-assessment, Sub-FIPI II developed an "Investment Plan for Recovery, Protection and Development of U Minh Thuong NP, Period 2003-2010"

According to this Investment Plan, UMT NP contained 601 ha of *Melaleuca* forest on pitland and over 1,000 ha of *Melaleuca* forest on acid land; 32 mammal species of 13 families, 8 orders; 147 bird species of 37 families, 13 orders; 32 reptile species of 11 families, 2 orders; 7 amphibian species of 3 families, 1 order. This study and also studies of other authors (Le Xuan Canh et al, 2002; Nguyen Xuan Dang et al, 2003, etc) showed that species diversity of vertebrate fauna after fire remained almost the same as before fire, but their abundance was significantly reduced.

In 2004, IEBR repeatedly conducted a rapid assessment of biodiversity in UMT NP. In its report, 299 species of vascular plants from 224 genera, 102 families; 32 mammal species from 12 families, 8 orders; 148 bird species from 31 families, 14 orders; 31 reptile species from 11 families, 2 orders; 7 amphibian species from 3 families, 1 order were reported to record in UMT NP (Le Xuan Canh et al., 2006). This study did not add significant number of species to previous list, possibly due to short survey duration. During recent years, Small Carnivore Programme (Cuc Phuong NP) and WAR conducted some wildlife surveys in UMT NP, however, results of these studies have not published.

Biodiversity in AB-AM Protection Forest have not studied yet. It can see that biodiversity of this area is much lower than in UMT NP.

2.2.3. Kien Luong – Kien Hai Area

This area is situated in Kien Luong – Kien Hai – Ha Tien Semi-Island with 30% of total area being hills and islands; the rest are coastal Protection Forests and *Melaleuca* forests. This area not only contains high biodiversity potential but also plays important role in coastal protection and national security protection. Therefore, since 1992, DARD of Kien Giang Province in collaboration with relevant organizations has conducted a number of surveys to establish Protection Forests and Nature reserve. After many changes in management structure, since 2008, this area

has been declared as "Hon Dat – Kien Ha NR and Protection Forests" which consists of Hon Chong NR in Kien Luong District (core zone: 868.4 ha, buffer zone 233.3 ha), coastal Protection Forest in Kien Luong, Kien Hai and Ha Tien Districts ((2,378.9 ha of mangrove forest) and Environment Protection Forest in Hon Dat District (7,013.1 ha of *Melaleuca* forest).

In spite of its multi-folder importance and changes in management structure, biodiversity of Kien Luong – Kien Hai area is poorly studied. The document that provides its first vegetation and floral assessment is "Investment Plan for Establishment of Kien Luong Protection and Ecosystem Conservation Forest, 2002–2010" by Sub-FIPI II in 2001. Unfortunately, we could not access to this document.

The "Investment Plan for Development of Kien Luong – Ha Tien – Kien Hai Special Use and Protection Forest" prepared by DARD of Kien Giang Province in 2002 reports 182 plant species belonging to 59 families (39 species found in Mangrove forests and 47 species found in *Melaleuca* forest) and 28 animal species. No species listed is included in this report.

In 2002, Birdlife International in Vietnam conducted rapid survey for identification Bird Important Areas in Vietnam. Kien Luong area was recognized as a Bird important area with occurrence of some endangered species such as White-winged Duck (*Pseudibis davisoni*), Sarus Crane (*Grus antigone*), Grey Pelican (*Pelicanus philippensis*), Painted Stork (*Mycteria leucocephala*) (Buckton et al., 2002).

In 2005, IEBR conducted rapid biodiversity assessment of Kien Luong – Kien Hai – Ha Tien forests. The report provided important dataset of biodiversity for this area. Reports recorded 760 species of vascular plants belonging to 485 genera and 144 families; 16 mammal species of 11 family, 6 orders; 74 bird species of 37 families, 11 orders; 49 reptile species of 14 families, 2 orders; 10 amphibian species of 2 families, 2 orders (Le Xuan Canh et al., 2006).

2.3. OVERALL EVALUATION

In spite of in-sufficiency, these studies show that KGCSR has very high biodiversity potential, namely:

- Diversity of ecosystems: six (6) ecosystems and 22 different habitat types were described (Table 2) with 4 ecosystems typical for Mekong Delta:
 - + *Melaleuca* forest on pitland
 - + Mangrove forest
 - + Primary and secondary forest with domination of family Dipterocarpaceae
 - + Coral reef and seagrass

Table 2. Main ecosystems and habitat types in KGBSR

No.	Ecosystems and habitat types	PQ	UMT - AB-AM	KL-KH
	I. Primary and Secondary forest with domination of family (Dipterocarpaceae)			
1.	Primary Dipterocarp forest	+		
2.	Secondary forest after logging or shifting cultivation	+		
3.	Grassland of <i>Imperata cylindrica</i>	+		
	II. Limestone forest with domination of <i>Trestonia mergensis</i> and <i>Dacrydium pierrei</i>			
4.	Limestone forest with domination of <i>Trestonia mergensis</i> and <i>Dacrydium pierrei</i>	+		
5.	Steep-sloped limestone mountain with scattered shrubs			+
	III. <i>Melaleuca</i> forests on acid lands			
6.	Mixed <i>Melaleuca</i> forest on pitland		+	
7.	<i>Melaleuca</i> forest on pitland		+	
8.	<i>Melaleuca</i> forest on acid land	+	+	
9.	Grassland of <i>Phragmites vallatoria</i>		+	+
10.	Grassland of <i>Eleocharis</i> spp.		+	+
11.	Open water with or without <i>Salvinia</i> , <i>Pistia</i> , <i>Nymphaea</i> , <i>Typha</i>		+	
12.	Muddy beaches with <i>Melaleuca</i> trees			+
13.	Fruit trees and crop plants on dykes		+	
	IV. Mangrove forest with <i>Rhizophora apiculata</i>			
14.	Mangrove forest	+		
15.	Tidal beaches with <i>Avicennia</i>			+
16.	Tidal beaches with sand and mud			+
17.	Saline beaches with recovery forest of <i>Avicennia</i> and <i>Rhizophora</i>			+
	V. Coastal scrubland			
18.	Open forest of Dipterocarpaceae	+		
19.	Arid scrubland	+		
20.	Regenerating forest and Scrubland with scattered trees			+
21.	Scrubland			+
	VI. Coral reef and seagrasses			
22.	Coral reef and seagrasses	+		
	Total:	9	7	9

Notes: PQ: Phu Quoc area, UMT-AB-AM:U Minh Thuong – An Bien – An Minh area, KL-KH: Kien Luong – Kien Hai area

- High species diversity and high number of rare species: totally, it was recorded in Phu Quoc area: 529 species of vascular plants, 247 species of vertebrate animals; in UMT-AB-AM area: 299 species of vascular plants, 442 species of animals; in Kien Luong-Kien Hai area: 760 species of vascular plants, 149 species of vertebrate animals. Out recorded species, about 760 plant species and

100 animal species are nationally and globally threatened with extinction (Table 3).

Table 3. Number of plant and animal species recorded in KGBSR

Taxonomic groups	Phu Quoc Area	UMT-AB-AM Area	Kien Luong-Kien Hai Area
Vascular plants	1164 species, 137 families, 66 order	299 species, 224 genera, 102 families	760 species, 485 genera, 144 families
Mammals	56 species, 18 families, 7 orders	31 species, 13 families, 8 orders	16 species, 11 families, 6 orders
Birds	119 species, 41 families, 11 orders	150 species, 38 families, 10 orders	74 species, 37 families, 10 orders
Reptiles	55 species, 10 families, 3 orders	38 species, 10 families, 2 orders	46 species, 11 families, 2 orders
Amphibians	17 species, 4 families, 1 order	7 species, 3 families, 1 order	13 species, 5 families, 2 orders
Fishes	Not studied	34 species, 17 families, 7 orders	Not studied
Insects	Not studied	181 species, 60 families, 11 orders	Not studied
Total:	Flora: 529 species Fauna: 247 species	Flora: 299 species Fauna: 442 species	Flora: 760 species Fauna: 149 species

Except for great contribution to discovery of biodiversity values and biodiversity management of KGBSR; previous studies also showed a number of shortages:

- The studies have concentrated mainly on Phu Quoc NP and UMT NP, other places did not or poorly investigated.
- In regard to plants, the studies concentrated on description of vegetation types and inventory of some plant groups, mainly vascular plants. There is almost no ecological study of critical communities and species of high conservation priority for relevant conservation measures
- Regarding to fauna, the studies mostly concentrated on large size and medium size vertebrates species, other groups did not or poorly studied. There is almost no ecological study of species of high conservation priority for relevant conservation measures.
- There is no systematic biodiversity monitoring and evaluation programme, except some botanical studies in UMT NP during CARE Project implementation.
- Due to rapid population growth and economic development in recent decades, environment quality and biodiversity value significantly changed. This makes the dataset out-of-date.

CHAPTER 3. RESULTS OF VEGETATION AND FLORAL ASSESSMENT IN KIEN GIANG BIOSPHERE RESERVE

3.1. PHU QUOC AREA

Phu Quoc NP was established in 2003 with total area of 31,422 ha. The NP is situated in Northern Phu Quoc Island with elevation ranging from 0-603 m absl. Abundance and diversity of flora and fauna in Phu Quoc island has draw attention of many scientists. Before 1990, Pham Hoang Ho conducted floral study and has inventoried 583 plant species (Pham Hoang Ho, 1985). In order to support effective management and development of Phu Quoc NP, during period from 2000 to 2006, Sub-FIPI II conducted a number surveys in Phu Quoc NR. These studies recorded 9 typical vegetation types, 1,164 species of vascular plants belonging to 137 families and 66 orders. In spite of some mistakes such as incorrect scientific name of some species, record of hoang dan *Cupressus torulosa* D.Don.1825 needs to be checked (as reported by Phan Ke Loc 2001, this species has narrow distribution range; in Vietnam this species was found only in low Cai Kinh limestone forests of Huu Lien Commune, Huu Lung District, Lang Son Province, Northmost province of Vietnam), etc., These studies provided very important data set for evaluation of floral biodiversity values and some features in Phu Quoc NP.

3.1.1. Vegetation cover

The vegetation cover of Phu Quoc NP is affected by many factors such as altitude, ocean climate and anthropological activities. It could roughly describe vegetation types of Phu Quoc NP by a sketch of section perpendicular to Rach Tram estuary (Figure 2). From the sketch, 6 following vegetation types can be described:

a) Mountain forest

This forest type is found in altitudes from 300 – 350m to 603m absl. The forest is characterized by trees of 10-12m high, with nearly equal diameter of 10-20 cm, high density of trees, very few canopy-immerging trees. Simple forest structure, usually consisting of 3 layers:

- Ecological domination layer: is 10-12m high with high tree density, round canopy and coverage of 60-70%.
- Second layer: under-canopy is not clearly showed with low tree density; trees of 3-5m high are young trees of upper layer or under-canopy scrubs, coverage of 10-20%.
- Third layer: ground layer is not dense, coverage of 10-15%, common species are from Poaceae, Cyperaceae, Zingiberaceae, Polypodiophyta, Asclepiadaceae, Araceae, etc.

In tree layer, common species are from Theaceae, Lauraceae, Clusiaceae. Typical characteristics of this vegetation type is existence of *Dacrydium elatum*, *Dacrycarpus imbricatus* and *Nageia wallichiana*.

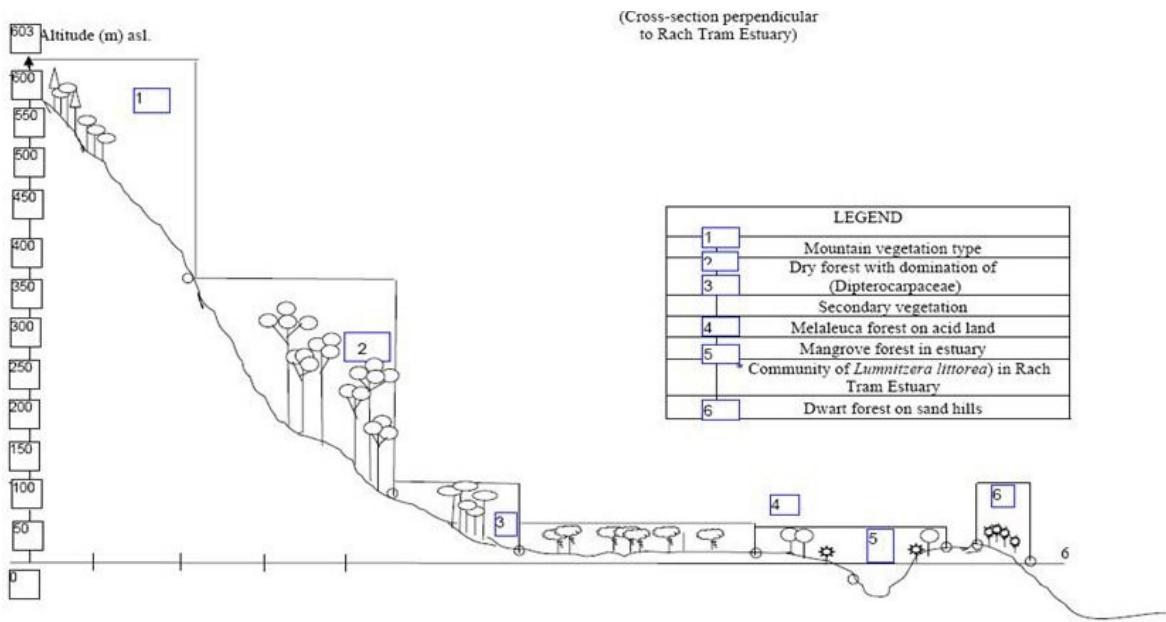

Figure 2. Sketch of vegetation types in Phu Quoc NP, Kien Giang province

Data from standard quadrate shows that plant density is relative high, about 70 trees ($D_{1.3} \geq 5$ cm)/ 200m², average density of over 3,000 trees /ha, average height of tree is 7.48cm, average stem diameter is 10.06cm. In this quadrate, there are 3 trees of *Dacrydium elatum* and *Dacrycarpus imbricatus*

c) Secondary forest

Secondary forest occupies large area in Phu Quoc NP. There are some differences between secondary forests regenerated from exhausted logging and those generated from agricultural fields. The difference occurs mainly in species composition. Secondary forests are found in elevations below 100m to 30-40m asl. The forest has 3 layers:

- Layer 1: tall trees of 8-12m high with high density. Data from standard quadrate shows 46 trees ($D_{1.3} \geq 5$ cm)/200m² or 2,300 trees/ha.
- Layer 2: shrubs with plants of 5-7m high and young regeneration trees of higher layer. In wet areas, tree density is high. Shrubs are families of Rubiaceae (genus *Psychotria*) and Euphorbiaceae.
- Layer 3: ground layer of 0.5-1.2m high; common species are from family Poaceae, Polypodiophyta, Cyperaceae, etc.

In some areas, there is a valuable timber species *Fagreca fragrans*. All big trees of this species were logged. In standard quadrate, 10 *Fagreca fragrans* trees are found within total number of 46 species. All these trees are regenerated from old logged stump. More study needs for this species, especially to study its seed-regenerating capacity.

d) Melaleuca forest on acid land

Natural *Melaleuca* forest on acid land follows secondary forest to Rach Tram River on elevation from 20-30m asl. Natural *Melaleuca* forest on acid land is transitional forest type of mountain forest to low flat valleys. These areas are inundated in rainy season, some are permanently inundated.

Forest structure consists of 2 layers:

- Layer 1: dominated by *Melaleuca cajuputi* of 5-7 m high, wide canopy, thick barks. In higher areas close to mountain, there are also trees resistant to drought, acidity from families Dipterocarpaceae, Theaceae, Myrtaceae. In flat inundated areas with high acidity, there is lower number of trees. In vicinity to river brackish water, appear also *Xylocarpus* sp., *Heliera litoralis*.
- Layer 2: in low flat areas, consists of many species from families of Cyperaceae, Poaceae; low bushes from families Myrtaceae, Melastomataceae, Polypodiophyta, Pandanaceae, Flagellariaceae, etc.

e) *Coastal mangrove forests*

This forest type is much different from above mentioned vegetation types in ecological conditions. This forest consists of many mangrove species (*Elaeocarpus tectorius*, *Avicennia* spp, *Sonneratia* spp., *Bruguiera* spp., *Ceriops* spp., *Lumnitzera* sp., *Lasianthus* sp., *Thespesis* sp., etc.)

Photo: Hà Văn Tué

Figure 3. Mangrove forest with stand of *Lumnitzera littorea*

Specific feature is found in Mangrove forest in Rach Tram estuary, where there is almost monotonous stand of *Lumnitzera littorea* with big trees, usually of 10-15m high, large diameter of 0.3-0.6m; some trees of about 1 m in diameter. This mangrove forest is also different from other mangrove forest with the absence of *Rhizophora apiculata*; there are only *Rhizophora stylosa* and *Rhizophora mucronata*. The *Rhizophora stylosa* and *Rhizophora. mucronata* appear closely to water, then follows stand *Lumnitzera littorea* and stand of *Melaleuca cajuputi*. We have observed mangrove forests in many areas of Vietnam, however, never seen a stand of *Lumnitzera littorea* which grows almost monotonously with big trees as in this

area. *Lumnitzera littorea* is endangered species listed in RDB VN (2007) at level VU (vulnerable). This stand needs more study for conservation.

f) *Dwarf forest on coastal sandy hills*

This vegetation type occurs at coordinates 0428736/1142035, altitude of 10m asl. This is special vegetation type which consists of one-layer structure of small timber trees or bush trees of relatively equal height (4-5m), large and round canopy, tailoring each other. Species composition is also simple, consisting of trees from several families: Myrtaceae, Apocynaceae, Sapotaceae, Verbenaceae, Bignoniaceae. Tree stems have specific features: short stem, rough and thick bark; branches concentrate in 2-3 points; each branch has many small branches, old branches become thorns, leaves are rigid, canopy concentrate on the peak of stem, largely expanded in front of an umbrella.

This forest type is unique by long evolutional adaptation to extreme environment conditions: soils, water, air, light and wind. This forest formulates boundary between mainland and sea water at altitude of 5-10m asl.

Photo: Hà Văn Tué

Figure 4. Dwarf forest on sand hills in Phu Quoc NP

Dwarf forest on coastal sand hills is rare in Vietnam, It occurs in small patches in some areas such as Bai Tu Long NP (in the end of Tra Ngo island), Ru Linh NR (Vinh Linh District, Quang Tri Province). This forest type can not recover if undergone destruction. This forest type must be protected and studied in more details for conservation.

We were informed that, in the area along sea lines from coordinates 0428736/1142035, altitude of 9m asl to Bai Dai Guard Station, at coordinates 0429482/1140017, altitude of 5m asl, there is plan to construct a STARBAY Ecotourism facility of about 541.79 ha. Except for this, there is also another project to develop tourism

base in area from Bai Dai Guard Station to coordinates 0433075/ 1137870, altitude of 10m asl. Implementation of these projects will completely destroy unique vegetation type "Dwarf forest on coastal sandy hills" of Phu Quoc NP. We would recommend competent authorities to:

- Conduct careful environmental impact assessment of these projects before implementation
- Conduct study of structure and ecological requirement of this forest types (soil, water, air,...) for relevant conservation measures. This forest type is poorly studied in Vietnam.

3.1.2. Flora

Due to the short survey duration (5 days), we can not carry out floral inventory. However, we could record some species which are not recorded by previous studies. They are:

- Family Amaranthaceae: *Amaranthes sessillis* (L.) DC.
- Family Combretaceae: *Quiqualis indica* (L.) and *Q. conferta* (Jack) Exell.
- Family Scrophulariaceae: *Scoparia dulcis* (L.)
- Family Dracaenaceae: *Dracaena cochinchinensis* (Lour.) S.C. Chen
- Family Taccaceae: *Tacca leontopetaloides* (L.) O. Ktze

Together with previous records, totally 1,172 species of vascular plants belonging to 562 genera, 137 families, 66 orders, 6 branches have been recorded in Phu Quoc NP (Table 4, Annex 2). This is only un-completed species list, further studies will add more species to the list.

Table 4. Updated number of floral taxa recorded in Phu Quoc NP

No.	Phyla	Order	Family	Genera	Species
1.	Lycopodiophyta	2	2	3	8
2.	Polypodiophyta	6	10	24	42
3.	Pinophyta	2	2	4	5
4.	Cycadophyta	1	1	1	1
5.	Gnetophyta	1	1	1	4
6.	Magnoliophyta	54	121	529	1112
Total: 6 phyla		66	137	562	1,172

This list indicate the flora of Phu Quoc NP is very diverse in taxonomic composition and Phu Quoc NP plays important role in biodiversity conservation. Besides, Phu Quoc flora helps to study the affect of ocean climate factors on flora.

Economic value of Phu Quoc flora is very high. We will not go details on this report, just mention about some very high valuable species that need special conservation concern such as: *Fagraea fragrans*, *Anisoptera costata*, *Dipterocapus grandifolius*, *Hopea pierrei*, *Hopea ferrea*, *Dalbergia cochinchinensis*, *Dysoxylum cauliflorum*, *D. loureiri*,...

Another interesting finding is that in mainland, *Dacrydium elatum*, *Decussocarpus fleuryi*, *Podocarpus imbricatus* normally occur at elevations above 800m asl in

Vietnam, however, in Phu Qoc NP, they naturally grow at altitude of 200m asl; more over, *Dacrydium elatum* grows even in inundated acid land together with mangrove trees in altitude of 1m asl.

3.1.3. Conservation values of flora

Except for high species diversity, Phu Quoc NP has 25 nationally endangered plant species (enlisted in RDB VN, 2007) and 9 globally endangered species (enlisted in IUCN RL, 2009 (Table 5). More globally threatened species can be found if more detailed study conducted.

Notes: RDB VN (2007) – Red Data Book of Vietnam, IUCN RL (2009) – IUCN Red List of Threatened species. **CR:**Critically endangered, **EN:** Endangered, **VU:** Vulnerable, **LR:** Low Risk, **NT:** Near threatened, **DD:** Data Deficient

Nationally endangered species include:

- + 17 species at VU category
- + 7 species at EN category
- + 1 species at CR category

Global endangered species include:

- + 3 species at EN category
- + 4 species at VU category
- + 2 species at NT category

As mentioned above, except these 25 conservation priority species, Phu Quoc NP also has 2 very rare vegetation types: Rach Tram estuary mangrove forest with pure stand of *Lumnitzera littorea* and Dwarf forest on sand hills.

3.2. U MINH THUONG – AN BIEN – AN MINH AREA

3.2.1. Vegetation cover

UMT NP has total area of 8.111ha. Before big fire in March 2002, the vegetation and flora of UMT NP was studied by Tran Triet (2000, 2001). This author described 4 main vegetation types:

- Forests: *Melaleuca* forest on pitland, *Melaleuca* forest on acid land, mixed *Melaleuca* forests
- Grassland and Meadow: Grassland with domination of *Phragmites vallatoria* and meadows with domination of *Eleocharis dulcis*
- Open wetland with *Nymphaea nouchali*, *Pistia stratiotes*, *Salvinia cucullata*, *Typha domingensis*, etc.
- Canals and natural streams

Tran Triet also reported 243 plant species belonging to 84 families with higher species number in families Poaceae (42 species); Cyperaceae (28 species); Asteraceae (12 species); Fabaceae (2 species), Rubiaceae (7 species). Study of Tran Triet has provided overall picture of vegetation types and flora in UMT NP. Here, the terms "Open land" and "Canal and flows" do not mean areas without vegetation but with floated plants such as *Pistia stratiotes*, *Salvinia cucullata*, *Nymphaea nouchali*, *Typha domingensis* etc. In 2003, IEBR using these data and additional findings to compile a checklist of 299 species and 109 families.

During this short survey, we spent most of our time in observing vegetation along canals using motorboat for travel. Therefore, we could additionally record only one more species for previous plant list of UMT NP, however, following problems of *Melaleuca* forests have been found:

a) *Natural Melaleuca forest*

According to previous study, in UMT-AB-AM area, there were 7,000ha of natural *Melaleuca* forest on pitland and acid land (AB-AM area: 3,000 ha; UMT NP: 4,000 ha). During forest fire in March 2002, about 3,000 ha of natural *Melaleuca* forest on pitland and 2,000 ha of regenerating *Melaleuca* forest of UMT NP were lost.

Our observation during this survey shows that, in forest compartment 1 of AB-AM area, there is 1,500 ha of natural *Melaleuca* forest. This forest keeps its natural status: straight stems, of 5-7m high, without dense growth of *Phragmites* and ferns remain under forest canopy. In some logged areas, re-planted *Melaleuca* trees are small and short. While in compartment II of An Minh and in UMT NP, natural forests loose their normal status: most of trees falls in different directions; in some places, the trees show abnormal growth with roots emerging over water surface, over-expanded stump, bare branches (no leaves); many *Melaleuca* trees died making forest canopy open for ferns and other lianas to climbing up to top of trees.

Photo: Hà Văn Tué

Figure 5. Natural *Melaleuca* forest in UMT NP

Similar picture is also found in *Melaleuca* forest regenerated after big fire: *Melaleuca* trees of 3-5m high died in many places leading to expansion of grasses, *Phragmites vallatoria*, *Eleocharis dulcis*, *Asplenium spp.*, *Nymphaea nouchali*, *Pistia stratiotes*, *Salvinia cucullata*, etc. In areas with low water (1.2-1.5m deep), appears cover of various floating plant species and aquatic plants.

High water level (0.6-1.2m deep) often retains for fire prevention significantly modifies natural growth of *Melaleuca* forests. This picture is most clear in Compartment 2 of AB – AM area and UMT NP. Many *Melaleuca* trees lost leaves and died. The decay of dead vegetation causes significant water pollution which disturbs the development of *Melaleuca* trees.

On the canals, floating vegetation is well developed covering about 60-79% water surface. This floating vegetation is undergone affected of wind blousing and daily motorboat movement.

b) Rhizophora plantations

Rhizophora plantations are of different ages. Plantations of the same age has relatively equal tree density, height and stem diameter. *Rhizophora* plantations are allocated to households for protection (3-5ha per household). Along boundaries of each household plantation there is a network of surrounding dykes for aquaculture or collecting natural aquatic resources. The *Rhizophora* plantations have only one layer of *Rhizophora* trees, under this layer there is a poor growth of some scattered fern or *Acanthus* clumps. Surrounding dykes disturb dispersal of *Rhizophora* sp. causing its poor regeneration state outside the dykes.

Photo: Hà Văn Tué

Figure 6. *Rhizophora* plantations in AB-AM area

c) Avicennia plantations

In AB-AM area, there is *Avicennia* planting programme for sea-encroachment. This area is increasing by year. In the areas after *Rhizophora* plantations (towards sea), *Avicennia* plantations reach 4-5m high with green thick canopy and healthy trees. Sea water and waves have brought *Avicennia* seeds 30-40 m far towards sea where a patch of *Avicennia* trees grow. This phenomenon must be studied to assess natural sea-encroachment capacity of mangrove forest.

Some patches of natural *Rhizophora* forests occur on higher hills where there is a community of mangrove trees such as *Avicennia* spp., *Rhizophora* spp., *Bruguiera* spp., *Lumnitzera racemosa*, *Nypa fruticans*, etc.

3.2.2. Flora

Forest types in UMT-AB-AM are more diverse than in UMT NP alone with inclusion of AB-AM mangrove forest. Therefore, number of species recorded in UMT-AB-AM area is higher than only in UMT NP (77 species belonging to 11 families). Totally, 387 species of 108 families have been found (Table 6).

Table 6. Number of plant taxa recorded in UMT-AB-AM Area

Phyla	Tran Triet, 2001		IEBR, 2006		Survey in 8/2009	
	Family	Species	Family	Species	Family	Species
POLYPODIOPHYTA	2	4	8	13	8	16
MAGNOLIOPSIDA	32	239	89	297	100	372
Total:	34	279	97	310	108	387

Dominated in this area are families which adapt to acid land, inundation, pitland or saline water such as Asteraceae, Poaceae, Cyperaceae, Rhizophoraceae Verbenaceae, Avicennia.

3.2.3. Conservation values of flora

Species composition of flora in UMT-AB-AM area is simple consisting mainly of herbaceous, lianas and grasses. Only one species is enlisted in RDB VN (2007) as VU –vulnerable: *Elaeocarpus hygrophilus* from family Elaeocarpaceae. This species has distribution range restrict to Mekong Delta.

3.3. KIEN LUONG – KIEN HAI AREA

3.3.1. Vegetation cover

Kien Luong – Kien Hai area has complicated terrains, which consists of Hon Chong mountain of 200-300m asl, limestone mountains of 300-400m asl along National Road No.80 and near Ha Tien Town, more than 100km long of coastal *Rhizophora* forests and a number of small islands with tall vegetation cover.

The complexity and especially existence of mountains make this area more diverse of habitat types and flora. Institute of Tropical Biology (in Ho Chi Minh City) conducted a number of surveys, however, there is no comprehensive report about the survey results. In 2005, IEBR conducted rapid biodiversity assessment for description of main vegetation types and floral species composition (Le Xuan Canh et al., 2006). During this survey, we could describe following vegetation types of Kien Luong – Kien Hai area.

a) Secondary forest restored after exhausted exploitation

Before 1990, forests in Hon Chong Mountain (Kien Luong District) and mountains near Ha Tien Town have been heavily exploited. However, since 1990, these forests received protection status for restoration. Therefore, at present, most of wood trees have almost the same height (10-12m) and diameter (10-15cm). The forests have 3 layers:

- Layer 1: many regenerating trees of 10-12 m high, equal canopies, coverage of 60-70%. Common species are from families of Clusiaceae, Fabaceae, Salpindaceae, Ebenaceae, Myristycaceae.
- Layer 2: scattered trees of 3-4m are young trees of higher layer or bush trees from families of Rubiaceae, Euphorbiaceae, Arecaeae.
- Layer 3: ground layer is not dense, of 0.5-1m high. Common species are from Polypodiophyta, families of Poaceae, Zingiberaceae.

Data from standard quadrat show density of 41 trees ($D \geq 5\text{cm}$)/ 200m^2 , or 2,000trees/ha; average height is 7.8m and average diameter is 11.84cm

b) *Rhizophora plantation*

Rhizophora plantations are of different age, 3-8m high. The *Rhizophora* plantations are simple in species composition, with only one layer, and coverage of 70-80%. Under canopy, very few plants grow. Not like mangrove forest in AB-AM area, mangrove forest in Kien Luong – Kien Hai area represents a narrow band and therefore few aquaculture sites exist.

Photo: Hà Văn Tué

Figure 7. Secondary forest restored after exhausted logging in Hon Chong NR

c) *Natural Avicennia forests*

In coastal line along National Road 80, except *Rhizophora* plantations, there are also some patches of Natural *Avicennia* forests. In these forests, *Avicennia* trees are absolutely dominated in ecological layer and also has high percentage in whole area. Only small area of this forest type remains, however, it differences from *Rhizophora* plantations: *Avicennia* forest has very high tree density, complicated layer structure, more abundance of plant species and has 3 layers:

- Layer 1: Ecological layer, 8-10m high, only *Avicennia* trees with large crown, many branches, branches are not straight, stem diameter of 20-40cm.
- Layer 2: Undercanopy layer, 5-7m high, many mangrove species such as *Rhizophora apiculata*, *Rhizophora mucronata*, *Avicennia spp.*, *Bruguiera spp.*;

- many lianas from family Fabaceae, genus *Derris*; families Convolvulaceae; Asclepiadaceae; Flagellariaceae.
- Layer 3: 0.5-1m high. Often seen are *Acrostichum aureum*, *Acanthus ebracteatus*, *A. ilicifolius*, and generating trees of *Avicennia spp*, *Bruguiera spp.*, *Xylocarpus spp.*.

In a standard quadrate ($200m^2$) set up in *Avicennia* forests of Kien Luong District, it contains 37 trees of diameter $\geq 5cm$. This indicates relatively high tree density, about 2,000 tree/ha, average diameter of 14.42cm, average height is 5.67m.

In comparison with *Rhizophora* forests, natural *Avicennia* forests have more layers and much higher diversity of species composition with many regenerating trees of *Rhizophora*, *Avicennia* and *Bruguiera*. Therefore, this forests should have better coastal protection function and biodiversity conservation significance.

Photo: Hà Văn Tué

Figure 8. Coastal Protection *Avicennia* forests (Kien Luong)

3.3.2. Flora

With complicated terrain, Kien Luong – Kien Hai area has diverse flora. In 2005, IEBR inventoried 760 species of vascular plants belonging to 485 genera, 144 families (Le Xuan Canh et al., 2006). During this survey, we could add 107 species of 13 families to the list. Totally, 867 species from 157 families of vascular plants were recorded in Kien Luong – Kien Hai area is (Table 7, Annex 3).

Table 7. Number of plant taxa recorded in Kien Luong – Kien Hai area

Phyla	IEBR, 2005		This survey - 8/2009	
	Families	Species	Families	Species
Polypodiophyta	11	20	11	23
Pinophyta	1	1	3	4
Magnoliophyta	132	739	143	840
Total:	144	760	157	867

Out of 867 recorded species, 224 species are wood trees from families Dipterocarpaceae, Rubiaceae, Fabaceae, Moraceae; 129 bush species from families Poaceae, Asteraceae, Cyperaceae.

3.3.3. Conservation values of flora

Flora of Kien Luong – Kien Hai area is poorly studied. Out of 867 recorded species, 21 species are nationally threatened, including 1 species at CR- critical, 8 species at En- endangered and 12 species at Vu – vulnerable. Four (4) species are globally threatened (Table 8).

Notes: RDB VN (2007) – Red Data Book of Vietnam, IUCN RL (2009) – IUCN Red List of Threatened species. CR: Critically endangered, EN: Endangered, VU: Vulnerable, LR: Low Risk, NT: Nearly threatened, DD: Data Deficient

Hon Chong Mountain, mountains surrounding Ha Tien Town and Limestone mountains in Kien Luong area should contain many species of conservation priority and also undiscovered species. We observed an endemic species to limestone mountain of Kien Luong - *Cycas litoralis*. Unfortunately, this species is exploited for sale near Quan Y Cave (Kien Luong District).

3.4. SOME MANAGEMENT PROBLEMS FOR VEGETATION AND FLORA

Management boards of Phu Quoc NP, UMT NP, AB-AM Coastal Protection Forest and Hon Dat – Kien Ha Special Use and Protection Forest have great effort to protect forest and vegetation cover. However, there are some problems associated with inappropriate management:

1. Retaining high water level for forest fire prevention causes negative effect on growth and development of Melaleuca forests

A long system of dykes and canal were established for round-year retaining high water level in compartments 1,2 of AB-AM area and in UMT NP. This causes some negative effects on natural *Melaleuca* forests.

Melaleuca trees can well develop only on seasonally inundated land with low water level (0.2-04m). The permanent retaining water level of 0.8-1.2m high in these areas has disturbed normal growth and development of *Melaleuca* forests. In many places, *Melaleuca* seeds could not reach bottom to grow due to deep water and thick stand of floated *phragmites*, ferns and other plants. Long stay under water also spoils germinating capacity of *Melaleuca* seeds.

In compartment 2 of AB-AM forest, *Melaleuca* trees grow in high density. Due to high water, many tall trees felt and died causing significant water pollution. Polluted water disturbs normal growth of *Melaleuca* trees, however, local farmers do not agree to discharge this water into canals and field on fear of depleting their agricultural plantations. This problem must be solved as soon as possible.

2. Conversion of forest land into land for development of tourism facilities in Phu Quoc NP

An area (541,79ha) of Phu Quoc NP from Ghenh Giau Guard Station (coordinates:0428736; 1142035. Altitude 9m) to Bai Dai Guard Station (Coordinates: 0429482; 1140017) is planned to construct StarBay Ecotourism facility, another tourism facility is also planned to built nearby. These constructions will completely destroy rare vegetation type "Dwarf forest on sand hills" (about 1,000 ha) of Phu Quoc NP. This forest type is very rare in Vietnam, and will not recover if undergone severe impacts. These projects should carefully reviewed to protect the rare habitat type of Vietnam. Ecotourism will also loose its attract if this vegetation types lost.

The unique large stand of *Lumnitzera littorea* in Rach Tram estuary also must be protected, because *Lumnitzera littorea* has been enlisted in RDB VN (2007).

3. System of dykes along household forests disturbs dispersal and natural regeneration of mangrove forest

In AB-AM coastal Protection forest, a system of dykes was established for aquaculture and harvesting of natural aquatic products. These dykes disturb dispersal and natural regeneration of mangrove plants, because the seeds can not freely distributed by normal tides due to being blocked by the dykes. Natural dispersal and regeneration of mangrove forest play important role in sea-encroachment of vegetation cover with formulation of good coastal forests

4. Encroachment of coastal Protection forest

Many households try to widen their aquacultural area by encroaching Protection forests. This illegal activity does not cause loss of large area at once, but by the time it will cause significant lose of coastal mangrove forest. The encroachment of forest land for construction of houses and shelters along roads also causes the significant decrease of coastal Protection forest area.

CHAPTER 4. ASSESSMENT OF MAMMAL FAUNA IN KIEN GIANG BIOSPHERE RESERVE

4.1. OVERALL ASSESSMENT OF KGBSR MAMMAL FAUNA

4.1.1. Diversity and taxonomic structure of mammal fauna

Previous studies (see Chapter 2) recorded 56 mammal species in Phu Quoc NP, 31 mammal species in UMT NP and 16 mammal species in Kien Luong – Kien Hai area. During this survey, we recorded 32 species in Phu Quoc NP, 16 species in UMT NP and 23 species in Kien Luong – Kien Hai area. In this short survey, number of recorded mammal species is lower than that from previous studies except in Kien Luong – Kien Hai area. Nevertheless, we could add a number of species to previous list, namely, 5 species for Phu Quoc NP and 12 species for Kien Luong – Kien Hai area. Totally, 77 species belonging to 20 families and 8 orders were recorded in KGBSR (Table 9, Annex 5) and number of species recorded in:

- Phu Quoc area is 61 species form 18 families and 7 orders
- UMT-AB-AM area is 31 species from 13 families and 8 orders
- Kien Luong – Kien Hai area is 28 species from 15 families and 8 orders

Table 9. Number of mammal taxa recorded in KGBSR

Period	Phu Quoc area			UMT-AB-AM			Kien Luong-Kien Hai		
	Species	Family	Order	Species	Family	Order	Species	Family	Order
Before this survey	56	18	7	31	13	8	16	11	6
This survey	32	18	7	16	10	7	23	14	7
New records from this survey	5	16	7	0	0	0	12	2	1
Total:	61	18	7	31	13	8	28	15	8
Total for KGBSR: 77 species, 20 families, 8 orders									

Note: UMT-AB-AM: U Minh Thuong – An Bien – An Minh area

Within 3 surveyed areas, number of recorded species is the highest in Phu Quoc area, then following to UMT-AB-AM area and the lowest in Kien Luong – Kien Hai area. Highest number of species recorded in Phu Quoc area can be explained by its more diversity of habitat types. The number of mammal species in Kien Luong – Kien Hai is the lowest because of few surveys conducted. Principally, the number of mammal species in this area must be higher than that in UMT area due to more diversity of habitat types. In all 3 surveyed areas, further studies will definitely add more species to current species list of each areas.

Regarding to taxonomic structure, the highest species diversity belongs to orders of Bats (Chiroptera), Rodents (Rodentia) and Carnivores (Carnivora). Large and medium-size animals are mainly from 2 orders: Carnivores (Carnivora) and Primates (Primates) (Table 10)

Table 10. Number of species by orders of KGBSR mammal fauna

No	Order	Phu Quoc (species)	UMT – AB - AM (species)	KL-KH (species)
1	Tree shrews - Scandentia	1	1	1
2	Primates - Primates	5	1	2
3	Shrews - Soricomorpha	2	2	2
4	Bats - Chiroptera	28	7	4
5	Pangolins - Pholidota	0	1	1
6	Carnivores - Carnivora	6	10	7
7	Ungulates - Artiodactyla	3	1	3
8	Rodents - Rodentia	16	8	8
	Total:	61	31	28

Note: UMT-AB-AM: U Minh Thuong – An Bien – An Minh area; KL-KH: Kien Luong – Kien Hai area

4.1.2. Species of conservation priority

Out of 77 mammal species recorded in KGBSR, 20 species (about 26% of total species number) are of conservation priority. They are 17 nationally threatened (enlisted in RDN VN, 2007) and 14 globally threatened species (enlisted in IUCN RL, 2009) (Table 11). Number of conservation priority species is highest in Phu Quoc NR with 14 species (12 species enlisted in RDB VN and 9 species enlisted in IUCN RL), then follows UMT NP with 11 species (8 species enlisted in RDB VN and 8 species enlisted in IUCN RL) and lowest in Kien Luong – Kien Hai area with 6 species (6 species enlisted in RDB VN and 3 species enlisted in IUCN RL).

Table 11. List of conservation priority mammal species in KGBSR

Notes: UMT-AB-AM: U Minh Thuong – An Bien – An Minh area; KL-KH: Kien Luong – Kien Hai area; RDB VN (2007) – Red Data Book of Vietnam, IUCN RL (2009) – IUCN Red List of Threatened species. **CR:** Critically endangered, **EN:** Endangered, **VU:** Vulnerable, **LR:** Low Risk, **NT:** Nearly threatened, **DD:** Data Deficient

Most species of conservation priority are large and medium-sized mammals. Based on conservation status, restrict distribution range and population size in studied area, 7 species are identified as special conservation priority including Hairy-nosed otter (*Lutra sumatrana*), Small-Clawed Otter (*Aonyx cinerea*), Jungle cat (*Felis chaus*), Fishing cat (*Prionailurus viverrinus*), Large Spotted civet (*Viverra megaspila*), Indochinese Silvered Langur (*Trachypithecus germaini*), Lyle's Flying Fox (*Pteropus lylei*) and Large Flying Fox (*Pteropus vampyrus*)

Hairy-nosed otter (*Lutra sumatrana*): This species is nationally and globally threatened at level EN – endangered. Currently, only few small populations remain in Thailand, Malaysia, Campuchia and Vietnam. In Vietnam, this species only finds in Mekong Delta, mainly in UMT NP. It may occur in other areas of KGBSR in small number.

Small clawed otter (*Aonyx cinerea*): this species is widespread in Southeast Asia, however, with small number. *Aonyx cinerea* is nationally and globally threatened species at level VU-vulnerable. In Vietnam, this species has wide distribution, however, has been extinct or nearly extinct in most of its range. Small clawed otter is quite abundant in UMT NP and also found in other areas of KGBSR (Phu Quoc NP, AB-AM Protection forests and Kien Luong – Kien Hai Special Use and Protection Forest

Jungle cat (*Felis chaus*): has wide distribution range in the World, however, very rare in Vietnam. Up to now, this species is recorded only in few localities (Gia Lai, Tay Ninh and Dak Lak Provinces) and always with very low density (only about 5 specimens collected so far from all localities). In Phu Quoc NP, Jungle cat is recently recorded. Based on encounter rate, it was estimated that the population of *Felis chaus* in Phu Quoc may be large (Hoang Trung Thanh et al, 2009). This species is enlisted in RDB VN 2007 as DD- data deficient due to lack of information.

Fishing cat (*Prionailurus viverrinus*): This species is highly threatened both nationally and globally (enlisted as EN- endangered in RDB VN and IUCN RL). Fishing cat widely distributes in many Asian countries, however, in all range, its populations are small and undergoing high threats. In Vietnam, Fishing cat is found in many provinces with very low density. However, in UMT NP, fishing cat is quite common. This species may occur in other areas of KGBSR but not yet recorded due to few surveys conducted.

Photo: Phạm Hồng Tuyền

Fishing cat in UMT NP

Photo: Hoàng Trung Thành

Jungle cat in Phu Quoc NP

Photo: Nguyễn Xuân Đặng

Small clawed otter in An Bien Forest

Figure 9. Some species of special conservation priority

Large spotted civet (*Viverra megaspila*): This species scatteredly distributes in Southeast Asian countries with very low number. Large spotted civet is nationally and

globally threatened at level VU-vulnerable. In Vietnam, this species found in few areas, while is quite common in UMT NP and may be other localities of KGBSR.

Indochinese silver langur (*Trachypithecus germaini*): Previously, only one species of silver langur (*Trachypithecus margarita*) was reported in Vietnam. However, results of genetic taxonomic study has recently revealed that 2 silver species occurs in Vietnam: Assamese silvered langur (*Trachypithecus margarita*) found in Central Vietnam and Indochinese silver langur (*Trachypithecus margarita*) found only in Kien Giang Province (Nadler et al., 2007).

Globally, Assamese silvered langur (*Trachypithecus margarita*) occurs in East side of Mekong Delta including Campuchia, Lao and Vietnam, while Indochinese silver langur (*Trachypithecus germaini*) occurs in West side of Mekong River including Thailand, Campuchia, Lao, Vietnam and Malaysia with small number. Indochinese silver langur is threatened at level VU-vulnerable in Vietnam and at level EN-endangered in the World. In Vietnam, this species occurs only Phu Quoc NP and Hon Chong NR of Kien Giang province, therefore, KGBSR plays the most important role in conservation of this species

Lyle's Flying Fox (*Pteropus lylei*) and Large Flying Fox (*Pteropus vampyrus*): are 2 globally endangered species of large fruit bats. Large Flying Fox occurs in some Asian countries while Lyle's Flying Fox occurs only in Thailand and West Southern Vietnam.

Two these species are not enlisted in RDB VN (2007) due their wide distribution in Mekong Delta, however, in practice, these species are significantly reduced and continue to reduce in number as a result of hunting and habitat loss. Large Flying Fox is enlisted in Governmental Decree 32/2006/NĐ-CP of Vietnam Government in group IIB (hunting and use are restricted and under control). Populations of these species in KGBSR are likely the largest in Vietnam, therefore, KGBSR plays important role on conservation of these species

4.2. ASSESSMENT BY SITES

4.2.1. Phu Quoc area

Phu Quoc area (31,422 ha) is situated in Northern part of Phu Quoc Island. The terrain consists of low hills (below 600m asl) with steep slopes, abundance of streams and valleys and diversity of habitat types: primary forest of Dipterocarp trees, Open forest of Dipterocarp trees, secondary forests, limestone forests, mangrove forest, *Melaleuca* forest, swamps and grasslands. Diversity of habitat together with ocean climates creates a diverse and unique mammal fauna.

Fauna of Phu Quoc area is not fully investigated, evidence of this is that new species continue to be discovered during recent years (Abramov et al. 2008; Hoang Trung Thanh et al., 2009, Nguyen Truong Son et al., 2009). Up to now, totally, 61 mammal species from 18 families and 7 orders were recorded. The species composition is dominated by orders Bats Chiroptera (28 species), Rodents Rodentia (16 species), Carnivora (6 species and Primates (5 species (Figure 10).

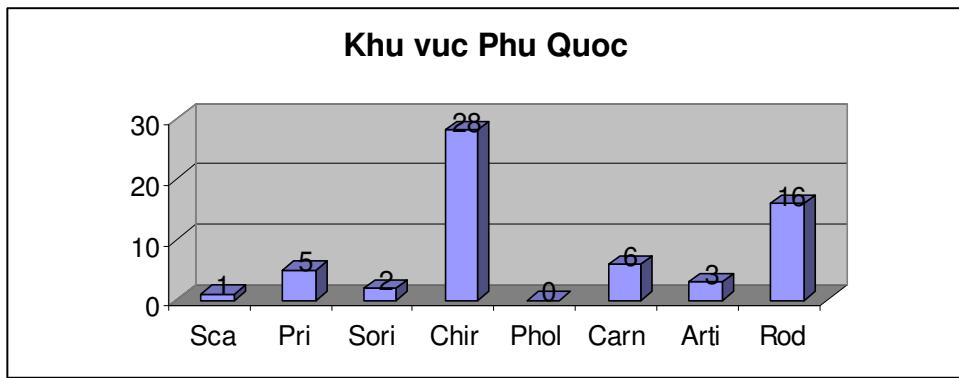

Figure 10. Comparison of species diversity between mammal orders

Sca: Scandentia, *Pri:* Primates, *Sori:* Soricomorpha, *Chir:* Chiroptera, *Phol:* Pholidota,
Carn: Carnivora, *Arti:* Artiodactyla, *Rod:* Rodentia

Except for high species diversity, mammal fauna of Phu Quoc area is characterized by high number of threatened species including 12 species enlisted in RDB VN (2007) and 9 species enlisted in IUCN RL (2009) (Table 11). Species of special conservation priority area Indochinese silver langur (*Trachypithecus germaini*), Jungle cat (*Felis chaus*), Grey-Cheeked Flying Squirrel (*Hylopetes lepidus*), Sambar deer (*Rusa unicolor*), Lyle's Flying Fox (*Pteropus lylei*), Large Flying Fox (*Pteropus vampyrus*), Slow loris (*Nycticebus bengalensis*). Population of Indochinese silver langur in Phu Quoc NP is the largest population of this species in Vietnam. Jungle cat in Phu Quoc NP may be also the largest population in Vietnam (Nguyen Trung Thanh et al. 2009 and Pham Trong Anh (pers.com.). Besides, Phu Quoc NP also contains endemic subspecies of Finlayson's squirrel *Callosciurus finlaysonii harmandi* (Milne-Edwards, 1877). Recently, a new shrew species – Phu Quoc shrew *Crocidura phuquocensis* was described based on specimens collected from Phu Quoc NP (Abramov et al.;, 2008). Populations of Slow loris (*Nycticebus coucang*), Pygmy loris (*Nycticebus pygmaeus*) and Sambar deer (*Rusa unicolor*) in Phu Quoc NP may be the only population of these species in KGBSR. In 2009, a group of scientists from WAR and IEBR observed a very large colony of Lyle's Flying Fox (*Pteropus lylei*) and Large Flying Fox (*Pteropus vampyrus*) in Phu Quoc NP, estimated up to 1,500 individuals (Lê Quỳnh at <http://www.sgtt.com.vn:80>, Nguyen Truong Son, pers.com.). This fact again indicates very important role of Phu Quoc NP on conservation of these bats species for Vietnam and the World.

Shortly, it can be recognized that mammal fauna in Phu Quoc area in general and Phu Quoc NP in particular is very diverse and has high conservation values. This fauna must be thoroughly studied for management and conservation

4.2.2. U Minh Thuong – An Bien – An Minh Area

UMT – AB – AM area includes UMT NP (8,111ha), buffer zone of UMT NP (13,068ha) and An Bien-An Minh Protection Forest. UMT NP is fresh water and brackish water wetlands with several typical habitat types such as *Melaleuca* forest on pitland, *Melaleuca* forest on acid land, *Phragmites* grassland, open swamps and agricultural lands. AB-AM area is coastal wetland with mangrove forest and other wetland habitats which severely affected by human activities. UMT-AB-AM area has

less diversity of habitats than those of Phu Quoc area and Kien Luong – Kien Hai areas, however, the habitats are typical and unique of Mekong Delta.

In comparison with others sites in KGBSR, mammal fauna in UMT-AB-AM area is the best surveyed. Nevertheless, study of small size mammals (Rodents Rodentia, Bats Chiroptera, small carnivores Mustelidae) is still limited. Mammals in UMT-AB-AM area are not diverse as those in Phu Quoc area and concentrate mostly in UMT NP. Up to now, totally, 31 species from 13 families and 8 orders were recorded (Annex 5). Species dominance belongs to orders Carnivora (10 species), Rodentia (8 species) and Bat Chiroptera (7 species). Order of Primates has been seriously depredated with the only one species (Long-tailed macaques *Macaca fascicularis*) remained in small number (our estimation is not exceed 300 individuals).

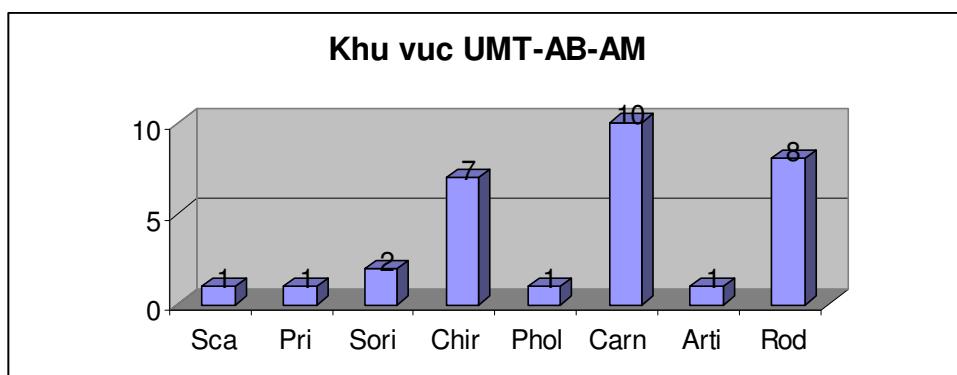

Figure 11. Comparison of species diversity between mammal orders

Sca: Scandentia, *Pri*: Primates, *Sori*: Soricomorpha, *Chir*: Chiroptera, *Phol*: Pholidota,
Carn: Carnivora, *Arti*: Artiodactyla, *Rod*: Rodentia

In spite of not high species diversity, mammal fauna of UMT-AB-AM area contains high conservation value due to the high number of nationally and globally threatened species and many of them have density much higher in other areas. Out of 31 recorded species, 11 species are of conservation priority including 8 species enlisted in RDB VN (2007) and 8 species enlisted in IUCN RL (2009); that account for about 35.5% total species number in the area. Species of special conservation priority are Hairy-nosed otter (*Lutra sumatrana*), Small clawed otter (*Aonyx cinerea*), Large spotted civet (*Viverra megaspila*), Fishing cat (*Prionailurus viverrinus*), Lyle's flying fox (*Pteropus lylei*) and Large flying fox (*Pteropus vampyrus*). Populations of these species in UMT NP are largest or second large populations in Vietnam. This relates especially to Hairy-nosed otter which possible remains only in Mekong Delta. Besides, a subspecies *Callosciurus finlaysonii cinnamomeus* (Temminckii, 1853) and subspecies *Sundasciurus hippocurus ornatus* Dao et Cao, 1990 are endemic to U Minh areas

Shortly, mammal fauna in UMT-AB-AM area is not diverse but contains high conservation value (35.5% total species number are nationally and globally threatened species). Significantly, some species have their largest populations in this area.

4.2.3. Kien Luong – Kien Hai area

Kien Luong – Kien Hai area (734,415 ha) consists of coastal Protection forests in Kien Luong and Kien Hai Districts and Hon Chong NR (about 1,000ha) in Kien Luong District. Outstanding feature of Kien Luong – Kien Hai area is a chain of low limestone mountains merging upto sea. Mountains in the South of Hon Chong Mountain are covered by forest plantation, mountains in the west lack of forests. Hon Chong mountain is covered by secondary evergreen tropical forests. Vegetation cover of Kien Luong – Kien Hai area consists of many habitat types such as limestone forests, mountain forest, coastal mangrove forest, ocean island with forests etc.

In spite of vegetation degradation, habitat diversity should harbor high flora and wildlife diversity. Unfortunately, flora and fauna in this area are still poorly studied (see Chapter 1 for details). In regard to mammal fauna, only 28 mammal species from 15 families and 8 orders are recorded. Studies in future will definitely add much more species to this species list.

Dominant species belongs to order of Rodentia (8 species), Carnivora (7 species) and Bat Chiroptera (4 species) (Figure 12). Large sized mammals have been considerably reduced and mammal species are recorded mainly in Hon Chong NR (lake, Binh An mountain, Moso mountain and Chua Hang mountains).

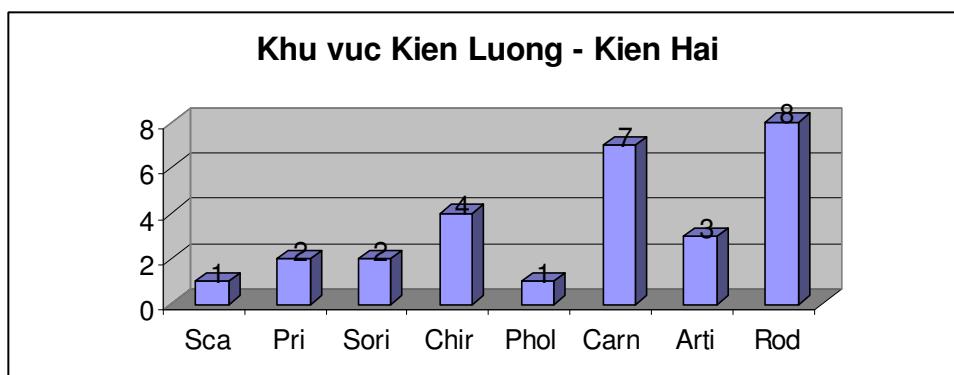

Figure 12. Comparison of species diversity between mammal orders

Sca: Scandentia, *Pri:* Primates, *Sori:* Soricomorpha, *Chir:* Chiroptera, *Phol:* Pholidota,
Carn: Carnivora, *Arti:* Artiodactyla, *Rod:* Rodentia

Six (6) species are of conservation priority (6 species enlisted in RDB VN 2007 and 3 species enlisted in IUCN RL 2009) were recorded in this area. Species of special conservation priority are Indochinese silver langur (*Trachypithecus germaini*), Long-tailed macaques (*Macaca fascicularis*) and Mouse deer (*Tragulus kanchil*). Especially, this area contains second population of Indochinese silver langur in Vietnam. During this survey, a group of 5-6 individuals of this species was observed in Chua Hang Mountain. As reported by local people, this population contain about

10-15 individuals . Kien Luong – Kien Hai area is the only place in KGBSR where Mouse deer still survives. Some caves with high number of bats have been found in this area.

Shortly, Kien Luong – Kien Hai area contains high mammal biodiversity, however, the fauna is still poorly studied.

4.3. THREATS TO MAMMAL FAUNA

Inside KGBSR, about 354,000 people live (People Committee of Kien Giang Province, 2005). Livelihood of major population depends on agriculture, aquaculture production and collection of forest products. Their livelihood is difficult and depends on forest products. Moreover, economic development, especially development of infrastructure constructions (roads, factories, sea harbor, urban living quarter, etc.) causes lots of negative impacts on local biodiversity resources. Below are main threats to biodiversity of KGBSR:

1. *Wildlife hunting and trade* occurs commonly in the area. Wild animals in general and mammals in particular are hunted for household use and also for sale in urban centers. Hunting is originated from local poverty and encouraged by outside traders. During this survey, we could observe a number of animals (Long-tailed macaque, Pig-tailed macaque, Banded squirrel, Finlayson's squirrels and other squirrel) which are caught from the wild and kept in very poor cages in Phu Quoc NP (Mr. Sau Khen house in Da Chong village, Coi Nguon Ecotourism Facility, etc.) and kept for sale in AB-AM area and Chua Hang area (Kien Luong District).

Photo: Phạm Đức Tiến

Figure 13. Mouse deer caught in Hon Chong NR (Kien Luong)

2. *Encroachment and disturbance of habitats*: due to high density of local peoples, habitat in study area are often undergoing encroachment for agriculture, aquaculture

and other purposes. This activity is especially in the areas outside protected areas. Unethical encroachment causes lots of disturbance for habitat security.

3. *Environmental pollution* caused by subsistence wastes, industrial wastes, use of insecticides, herbicides and toxic rat baits.

4. *Negative impacts of socio-economic development and tourism:* There are many socioeconomic development projects such as Cement factories, Thermo-electricity factory, tourism facilities, etc.). These projects often cause significantly negative impacts on surrounding environment and animals themselves if impact assessment is not conducted and mitigation measures are not applied.

SHORTLY, KGBSR contains high mammal diversity. Due to few surveys conducted, up to now, only 77 mammal species were recorded. Further surveys in future will definitely add more species to this primary list of KGBSR.

Number of large and medium-sized mammal species is not high, however, most of recorded species have high conservation significance. More over, some of them have much higher density in comparison with those in other areas of Vietnam. This indicates high importance of KGBSR for biodiversity conservation and threatened and rare species in particularly.

Mammals in KGBSR are facing with considerable pressures and threats that lead to the degradation. Therefore, a monitoring and evaluation programme must be applied to develop relevant management measures.

CHAPTER 5. ASSESSMENT OF BIRD FAUNA IN KIEN GIANG BIOSPHERE RESERVE

5.1. OVERALL ASSESSMENT FOR KGBSR

5.1.1. Species diversity and taxonomic composition

Previous studies (see Chapter 2) has recorded 119 bird species in Phu Quoc NP, 151 bird species in UMT NP and 74 bird species in Kien Luong – Kien Hai area. During this survey, we recorded 63 species in Phu Quoc NP, 72 species in UMT-AB-AM area and 56 species in Kien Luong – Kien Hai area. In this survey, number of recorded species is not high, usually lower than previous species list. Nevertheless, we could add 2 species to previous list of UMT NP and 23 species to previous list of Kien Luong – Kien Hai area. Totally, 222 bird species from 50 families and 11 orders were recorded in KGBSR (Table 12; Annex 6):

- Phu Quoc area: 143 species from 37 families and 11 orders
- UMT-AB-AM area: 152 species from 38 families and 10 orders
- Kien Luong – Kien Hai area: 95 species from 37 families and 10 orders.

Table 12. Species diversity of bird fauna in KGBSR

Period	Phu Quoc			UMT-AB-AM			Kien Luong-Kien Hai		
	Species	Family	Order	Species	Family	Order	Species	Family	Order
Before this survey	119	41	11	150	38	10	74	37	10
This survey	63	27	10	72	29	9	56	28	10
Additional records in this survey	0	0	0	2	0	0	23	0	0
Total:	134	37	11	152	38	10	95	37	10
Total for KGBSR: 222 species, 50 families, 11 orders									

Note: UMT-AB-AM: U Minh Thượng – An Biên – An Minh area

Number of 222 species recorded is not exhausted species number in KGBSR, however, it indicates high species diversity of bird fauna in this area. The number of recorded species represents 26.8% total bird species found in Vietnam. Out of 3 surveyed areas, UMT-AB-AM area has the highest species number, then follows Phu Quoc area and the lowest number is in Kien Luong – Kien Hai area. The highest number in UMT-AB-AM area is possibly because of the best investigation status. Low number in Kien Luong – Kien Hai area is because of poor investigation. The number of bird species in Phu Quoc area and Kien Luong – Kien Hai area is much higher than other sites due to the habitat diversity.

Regarding to taxonomic structure, the highest species number belongs to order of Passeriformes (95 species, 43,79% of total number in study area), then follows Ciconiformes (68 species, 30.63%). Coraciformes and Cuculiformes have 8 species each (3.6%). Bucerotiformes is the lowest with 2 species (0.9%) (Table 13).

Table 13. Species number by orders of bird fauna in KGBSR

No.	Order	No. families	No. species
1	Anseriformes	3	5
2	Piciformes	2	7
3	Bucerotiformes	1	2
4	Coraciiformes	5	11
5	Cuculiformes	3	11
6	Apodiformes	1	3
7	Strigiformes	3	4
8	Columbiformes	1	8
9	Gruiformes	2	8
10	Ciconiiformes	15	68
11	Passeriformes	16	95
Total: 11 orders		50	222

5.1.2. Species of conservation priority

Out of 222 species recorded in KGBSR, 19 species are of conservation priority (Table 14), including:

- 13 nationally threatened species (enlisted in RDB VN, 2007): 2 species at EN-endangered; 10 species at VU-vulnerable and 1 species at LR-low risk.
- 16 globally threatened species (enlisted in IUCN RL, 2009): 5 species at VU-vulnerable and 11 species at NT-near threatened

Number of conservation priority species is the highest in UMT NP (15 species), then follows Phu Quoc NP (5 species) and Kien Luong – Kien Hai area (3 species).

Table 14. Bird species of conservation priority recorded in KGBSR

No.	Vietnamese name	Scientific name	Distribution			Threatening level	
			PQ	UMT-AB-AM	KL K H	RDB VN 2007	IUCN RL 2009
1	Hồng hoàng	<i>Buceros bicornis</i>	+			VU	NT
2	Cú lợn lưng nâu	<i>Tyto capensis</i>		+		VU	
3	Sếu cổ trại	<i>Grus antigone</i>			+	VU	VU
4	Chóát mỏ thẳng đuôi đen	<i>Limosa limosa</i>		+			NT

Total:			5	15	3	13	16

Notes: PQ: Phu Quoc NP, UMT-AB-AM: U Minh Thuong – An Bien – An Minh area; KL-KH: Kien Luong – Kien Hai area; RDB VN (2007) – Red Data Book of Vietnam, IUCN RL (2009) – IUCN Red List of Threatened species. CR: Critically endangered, EN: Endangered, VU: Vulnerable, LR: Low Risk, NT: Near threatened, DD: Data Deficient

Species of special conservation priority are Sarus crane (*Grus antigone*), Indian Darter (*Anhinga melanogaster*), Grey Pelican (*Pelecanus philippensis*), Lesser Adjutant Stork (*Leptoptilos javanicus*) and Great Indian Hornbill (*Buceros bicornis*).

- **Great Indian Hornbill (*Buceros bicornis*)**

Great Indian Hornbill occurs in India, China and Southeast Asian countries. In Vietnam, this species is significantly reduced in the number as a result of hunting and forest degradation. During this survey, 2 individuals were observed in Phu Quoc NP (coordinates 10°19'56,1"N/ 103°59'10,5"E, altitude 39m). Interview information report that this species is quite common in Phu Quoc NP.

- **White-bellied Sea Eagle (*Haliaeetus leucogaster*)**

This species has distributed in India, Australia, Mianma, Malaysia and Indochina. In Vietnam, it was found in Khanh Hoa, Binh Thuan, some provinces of Mekong Delta and Con Dao island. In Phu Quoc NP, White-bellied Sea Eagle is reported quite abundant , this species is facing with severe hunting and trade currently. During this survey, no direct observation of this species was obtained. This species is illegally kept in large number in some tourism facilities in Phu Quoc Island for tourists attract.

- **Grey-headed Fishing Eagle (*Icthyophaga ichthyaetus*)**

This species occurs in a number of Asian contries. In Vietnam, it was recorded in many provinces from Lai Chau to Kien Giang. This species is reported to exist in Phu Quoc NP in very small number. During this survey, no direct sighting of this species was obtained.

Photo: Phạm Đức Tiến
A bird colony with about 3000 individuals of Indian Darter nesting in UMT NP

Figure 14. Some bird species of conservation priority

- **Indian Darter (*Anhinga melanogaster*)**

This species occurs in India and some Southeast Asian Countries. In Vietnam, it occurs in almost all provinces of Mekong Delta, including UMT NP. It is reported that after big forest fire in March 2002 , this species has increased in the number (several hundreds individuals) in UMT NP and now nesting in this area. During this survey, we could observe a colony of about 300 individuals nesting in UMT NP, at coordinates 09°33'03,2"N/ 105°06'26,5"E.

- **Lesser Adjutant Stork (*Leptoptilos javanicus*)**

This species occurs in India, Srilanca, Mianma, Southeastern China, ThaiLand, Malaysia and Indochina. In Vietnam, it was found in Central and Southern Vietnam. This species is facing significantly reduced the number due to hunting and habitat loss. The birds often seen feeding in coastal mangrove forest, muddy beaches and inundated grasslands. During this survey, one individual was seen in UMT NP (coordinates 09°34'01,0"N/ 105°06'26,7"E), in 7 August 2009. It is reported that, at presents, about 200 individuals of this species live in UMT NP.

- **Sarus crane (*Grus antigone*)**

Sarus crane distributes in Southeast Asia. In Vietnam, it occurs mainly in Mekong Delta. In KGBSR, sarus crane is reported to occur in Kien Luong District (Mo So field) with very few number. This area is now severely affected by human activities and no more serving as the feeding ground for sarus crane. This species is usually found in Mekong Delta during October to March next year. During this survey, no direct sighting of sarus crane was obtained.

- **Painted Stork (*Mycteria leucocephala*)**

Painted stock distributes in Southeast Asian countries. In Vietnam, it is often seen in *Melaleuca* forest and Mangrove forests of Mekong Delta and Cat Tien NP (Dong Nai Province). This species is reduced in number due to hunting and habitat loss. During this survey, no direct sighting of this species was obtained.

- **Grey Pelican (*Pelecanus philippensis*)**

Grey pelican occurs in India, Mianma, Campuchia and Vietnam. In Vietnam, it was found in river estuary in Nam Dinh Province, coastal area of Mekong Delta. In KGBSR, this species was found in UMT NP and Kien Luong District with low number. During this survey, no direct observation of this species was obtained.

5.2. ASSESSMENT BY SITES

5.2.1. Phu Quoc area

Up to now, it was recorded in Phu Quoc NP 134 bird species from 37 families and 11 orders (Table 12; Annex 6). In this short survey, we could not assess their abundance. However, it can see some species with relative high abundance such as Great Indian Hornbill (*Buceros bicornis*), Indian Pied Hornbill (*Anthracoceros albirostris*), etc. Out of 134 recorded species, 5 species are of conservation priority

(Table 14), including 3 species enlisted in RDB VN, 2007 and 5 species recorded in IUCN RL, 2009. Great Indian Hornbill (*Buceros bicornis*) is reported to be reduced in number due to forest destruction and hunting for meat and bills for decoration. Other 2 species White-bellied Sea Eagle (*Haliaeetus leucogaster*) and Brahminy Kite (*Haliastur indus*) are facing with hunting for trade in large number.

Primary evergreen forest and secondary forest have the highest number of species (92 species, 68.66% total species number), then follows *Melaleuca* forests with 35 species (26.12%); lowest number is found in openlands, grasslands, swamps,.. with 30 species (22.39%) (Table 15). Lowland and mountain preliminary and secondary evergreen forests are important habitats for a number of endangered species such as Great Indian Hornbill (*Buceros bicornis*), Indian Pied Hornbill (*Anthracoceros albirostris*),...

Table 15. Main habitat types and distribution of birds

No.	Habitat type	No. species	Endangered species
1	Mountain and Lowland primary and secondary evergreen forest	92	Great Indian Hornbill (<i>Buceros bicornis</i>), Indian Pied Hornbill (<i>Anthracoceros albirostris</i>)
2	Coastal mangrove forests	77	White-bellied Sea Eagle (<i>Haliaeetus leucogaster</i>)
3	<i>Melaleuca</i> forests	35	No
4	Openland, swamp, wetland meadow, etc.	30	Malaysian Sand Plover (<i>Charadrius peronii</i>)

5.2.2. UMT – AB – AM Area

Up to now, 152 species from 38 families and 9 orders were recorded in UMT – AB – AM Area (Table 12, Annex 6). During this survey we discovered 2 more species for UMT NP. According to previous studies, 2 species, sarus crane (*Grus antigone*) and Grey Pelican (*Pelecanus philippensis*) were found in UMT NP. During this survey, we could not get any direct observation of these species. Local residents also reported not see these species for many years.

Short survey duration does not allow us to assess species abundance. However, some species are commonly seen in UMT NP include Indian Darter (*Anhinga melanogaster*), Grey Heron (*Ardea cinerea*), Great Frigate Bird (*Fregata minor*), Lesser Adjutant Stork (*Leptoptilos javanicus*), etc.

Out of 152 species recorded in UMT – AB – AM Area, 15 species are of conservation priority (Table 14). Some of them have relatively higher abundance in study area, especially, Indian Darter (*Anhinga melanogaster*) (estimated as about 300 individuals) and Lesser Adjutant Stork (*Leptoptilos javanicus*) (estimated as about 200 individuals). These species have restricted distribution range and very low number in Vietnam.

In UMT – AB – AM Area, *Melaleuca* forest inhabits the highest number of bird species (89 species, 58.59% of total species number), then follows coastal mangrove forest with 70 species (46.05%) and Grasslands along dykes with 68 species

(44.74%). The lowest number is found in openland, inundated area, meadows, agriculture land with 54 species (35.53%) (Table 16).

Table 16. Main habitat types and bird distribution in UMT-AB-AM area

No.	Habitat types	No. of species	Endangered species
1	Coastal mangrove forest	70	Grey-headed Fishing Eagle (<i>Icthyophaga ichthyaetus</i>)
2	<i>Melaleuca</i> forests	89	Greater Spotted Eagle (<i>Aquila clanga</i>), Indian Darter (<i>Anhinga melanogaster</i>), Lesser Adjutant Stork (<i>Leptoptilos javanicus</i>), Woolly-necked Stork (<i>Ciconia episcopus</i>)
3	Grassland along dykes	68	Asian Golden Weaver (<i>Ploceus hypoxanthus</i>), Yellow-breasted Bunting (<i>Emberiza aureola</i>)
4	Openland, inundated area, swamp, agriculture land meadow.	54	Indian Darter (<i>Anhinga melanogaster</i>), Lesser Adjutant Stork (<i>Leptoptilos javanicus</i>), Javanese Cormorant (<i>Pharacrocorax niger</i>)

Melaleuca forests and open habitats are feeding ground and nesting sites for some important endangered species such as Indian Darter (*Anhinga melanogaster*), Lesser Adjutant Stork (*Leptoptilos javanicus*), Javanese Cormorant (*Pharacrocorax niger*),...

During this survey, a large bird colony (about 20ha) was observed in UMT NR where many species are nesting in large number such as Indian Darter (*Anhinga melanogaster*), Javanese Cormorant (*Pharacrocorax niger*), Woolly-necked Stork (*Ciconia episcopus*), etc. The birds break the branches of *Melaleuca* trees to make their nests. This activity will lead to death of *Melaleuca* trees after few years, then colony should move to new place. There is lack statistical data on bird colonies in UMT NP.

5.2.3. Kien Luong – Kien Hai area

Up to now, it was recorded 95 bird species from 37 families and 10 orders (Table 12; Annex 6). This survey has added 23 species to previous bird list of this area. Two species, Black ibis (*Pseudibis davisoni*) and Grey Pelican (*Pelecanus philippensis*) were reported to occur in this area (Buckton et al. 2000). During this survey, no direct sighting of these species was obtained and local interviewees confirm that these species are did not appear in this area for many years. Due to short survey duration,

we can not assess abundance of all species, however, some species seem quite abundant in this area are Javanese Cormorant (*Pharacrocorax niger*), Egrets (*Egretta spp.*), Herons (*Nycticorax*, *Gorsachius*),etc. while also some endangered species are very rarely seen in this area such as Sarus crane (*Grus antigone*), Painted Stork (*Mycteria leucocephala*),etc. Out of 95 bird species recorded in Kien Luong – Kien Hai area, 3 species are of conservation priority (Table 14). Sarus crane (*Grus antigone*) is reported to see only in Mo So area of Kien Luong District.

Within all habitat types occurring in Kien Luong – Kien Hai area, coastal mangrove forest has the highest number of recorded species (60 species, 63.16% of total species number). 2 other habitat types (mountain or lowland secondary forest and openlands) have 39 species each (41.05%) (Table 17).

Table 17. Main habitat types and bird distribution in Kien Luong – Kien Hai area

No	Habitat type	No. of species	Threatened species
1	Lowland secondary forest	39	No
2	Coastal mangrove forest	60	No
3	Openland (swamps, agriculture land, grasslands, meadows)	39	Sarus crane (<i>Grus antigone</i>) Painted Stork (<i>Mycteria leucocephala</i>), Woolly-necked Stork (<i>Ciconia episcopus</i>)

Secondary evergreen forest in Hon Chong mountain (Kien Luong District) is an important habitat for many forest birds. Bird fauna in this habitat is poorly studied, therefore, many species are likely unidentified.

One large bird colony was observed in *Rhizophora* forest of a local household (coordinates $0^{\circ}13'03.8''N$ - $104^{\circ}35'34.7''E$, altitude: 8m) with large number of many species such us Javanese Cormorant (*Pharacrocorax niger*), Egrets (*Egretta spp.*), Herons (*Nycticorax*, *Gorsachius*),etc. As reported by the forest owner, this colony appeared in 1993 with much less number of birds, then the number of birds is increased by the time.

5.3. Threat to bird fauna

1. *Wildlife hunting and trade* is common in study area: Birds and other wild animals are hunted for household use and for sale in urban centers as pet (White-bellied Sea Eagle *Haliaeetus leucogaster*, Brahminy Kite *Haliastur indus*, etc.) or as special dishes in restaurants (Doves *Streptopelia spp.*, Stonechat *Saxicola spp.*). Hunting pressure is driven by poverty and wildlife trade.

2. *Habitat encroachment and disturbance*: due to the high density of human population, habitats in KGBSR are always undergo encroachment for agriculture cultivation, aquaculture and disturbance by high rate of human entrance. Habitat encroachment causes loss or reduction of habitat area and feeding grounds for birds. Reduction and disturbance of *Melaleuca* forest, meadows, mangrove forests may eliminate important endangered species from this area such as Sarus crane (*Grus*

antigone), Grey Pelican (*Pelecanus philippensis*), Lesser Adjutant Stork (*Leptoptilos javanicus*), etc.

3. *Environmental impact by socio-economic development and tourism:* In KGBSR, there are many development projects that will cause negative impacts on forests and other wildlife habitats such as cement factory, thermo-electricity factory and tourism base in Kien Luong area; tourism and resort facilities in Phu Quoc area, etc. These projects must conduct proper environment impact assessment for mitigation measures

In KGBSR, it was recorded 222 bird species belonging to 50 families and 11 orders. This is a not exhausted species list of birds in KGBSR because the fauna is poorly studied. Further surveys will definitely add much more species to this list. Out of 222 bird species recorded, 19 species are of conservation priority. Some of these species (Indian Darter *Anhinga melanogaster*), Lesser Adjutant Stork *Leptoptilos javanicus*, etc.) have much higher number in comparison with those in other areas of Vietnam. This indicates the importance of KGBSR on conservation of bird biodiversity not only for Vietnam but also for the World.

CHAPTER 6. ASSESSMENT OF HERPETO FAUNA IN KIEN GIANG BIOSPHERE RESERVE

6.1. OVERALL ASSESSMENT FOR KGBSR

6.1.1. Species diversity and faunal characteristics

Previous studies (see Chapter 2) have recorded 17 amphibian species and 55 reptile species in Phu Quoc NP; 7 amphibian species and 38 reptile species in UMT NP and 7 amphibian species and 46 reptile species in Kien Luong – Kien Hai area. Some species from these lists may not correctly identified. During this survey, we recorded 33 amphibian and reptile species in Phu Quoc NP, 23 amphibian and reptile species in UMT NP and 20 amphibian and reptile species in Kien Luong – Kien Hai area. Combining results of previous studies (after correction) and our survey, we can make an updated herpetological list for KGBSR which consists of 107 species from 20 families and 5 orders (23 amphibian species from 6 families, 2 orders and 85 reptile species from 14 families and 3 orders) (Table 18, Annex 7).

Table 18. Number of herpetological species recorded in KGBSR

Area	Amphibian	Reptile	Total	%
Phu Quoc	17	55	72	69,2
UMT-AB-AM	7	38	45	42,3
Kien Luong – Kien Hai	13	46	59	54,0
Total :	23	85	107	100

This list of 107 species is still not exhausted list of herpetofauna in KGBSR because the fauna is still poorly studies. Further surveys will certainly increase the number species. Four (4) species of genera *Hemidactylus*, *Dixonius*, *Sphenomorphus* and *Scincella* are not surely identified due to not enough specimens collected. Some features of KGBSR herpetofauna can be noted as following:

Herpetofauna of KGBSR contains relatively high species diversity, but it is not as diverse as in other protected areas in Northern and Central Vietnam. This is because of several reasons such as smaller area of natural forests, less habitat diversity, simple terrain, other environment conditions and still less surveyed.

The fauna contains large number of species typical for herpetofauna in Southern Delta such as snakes *Enhydris bocourti*, *Enhydris innotinata*, *Enhydris subtaeniata*, *Erpeton tentaculatum* and turtle *Heosemys annandalii*. Some species are rarely seen in other places but were found in KGBSR such as gekkons *Cyrtodactylus condorensis*, *Ptychozoon lionotum*. Especially, unlike in other places of Vietnam, genera *Enhydris* is very abundant in KGBSR and 6 of 7 species of this genera were found here.

Except for Saltwater crocodile *Crocodylus porosus* which was extinct from the wild, some other species may be no more exist in KGBSR such as: turtle *Batagur basca*, *Dermochelys coriacea*, *Lepidochelys olivacea*. Two species, *Pelodiscus sinensis* and

Crocodylus siamensis are introduced to KGBSR as captive breeding stocks in households

Sea living are 8 species (4 sea snake and 4 sea turtle species); freshwater living: 12 species including toads *Occidozyga spp.*, snakes *Enhydris spp.*, *Xenochrophis flavipunctatus*, *Bungarus fasciatus*, turtle *Amysda cartilaginea*. On land or underland living: 46 species such as toads, many frogs, *Leiolepis reevesii*, lizard *Cyrtodactylus*, many snakes, turtles, etc. Tree living: 12 species such as tree frogs (Rhacophoridae), lizards *Calotes spp.*, *Eutropis spp.*, gekkos *Cyrtodactylus spp.*, gekko gecko, etc. Some species live in two habitat types such as on trees and on land: *Acanthosaura lepidogaster*, *Calotes versicolor*, snakes *Dendrelaphis pictus*, *Coelognathus radiata*, *Ptyas korros*, etc.; on land and in water: frogs, *Bungarus fasciatus*, *Enhydris plumbea*, etc.

A number species recorded in KGBSR are found only in South Vietnam such as: varan *Varanus nebulosus* and snake *Naja kaouthia* occur only from Quang Tri Province southwards; snake *Cerberus rhynchos*, tree lizard *Acanthosaura capra* occur only from Khanh Hoa Province southwards; tree frog *Theloderma stellatum*, cobra *Naja siamensis* occur only from Kon Tum Province southwards; frog *Limnonectes dabanus* occurs only from Dak Lak province southwards; lizards *Cyrtodactylus condorensis*, *Hemidactylus platyurus* occur only from Baria-Vung Tau Province southwards; snake *Cryptelythrops macrops* occurs only in Dong Nai and Kien Giang and Ca Mau Provinces; lizards *Cyrtodactylus intermedius*, *Ptychozoon lionotum* occur only in Dong Nai and Kien Giang Province.

Due to the short survey time, we can not assess species abundance, however, herpetological species in KGBSR can divide into 2 groups as following:

- Species of high abundance are species of small-size, wide distribution in Vietnam, non- or little-use by local residents, They are lizards *Hemidactylus*, frogs *Microhyla*, *Micryletta*, *Occidozyga*, *Hylarana*, *Polypedates leucomystax*, *Kaloula pulchra*, tree lizard *Acanthosaura*, skinks *Eutropis*, ect.
- Species rarely seen in the wild are species of large size, use for food and medicine or high commercial values. They are varans *Varanus spp.*, pythons *Python spp.*, many snakes, turtles, gecko, lizard *Draco maculatus*, etc. Number of these species is significantly reduced due to high market demand. Especially, sea turtles (*Chelonia mydas* *Eretmochelys imbricata*) are very rare seen, about 1-2 times per year.

6.1.2. Species of conservation priority

Out of 107 recorded species, 27 species are of conservation priority (enlisted in RDB VN, 2007 and IUCN RL, 2009) (Table 19), including:

- 26 species enlisted in RDB VN, 2007: 4 species at CR-critically endangered, 11 species at VU-vulnerable
- 12 species enlisted in IUCN RL, 2009: 2 species at CR-critically endangered, 6 species at VU-vulnerable and 2 species at NT-near threatened.
- 12 species enlisted in both red list.

Table 19. Herpetological species of conservation priority recorded in KGBSR

No.	Vietnamese name	Scientific name	Distribution			Threatening level

Figure 15. Some herpetological species of conservation priority

Several species that are new for science have just found in KGBSR by scientists from Institute of Tropical Biology such as White-tailed gecko (*Cnemaspis caudanivea*) described in 2007 from Hon Tre Island (Kien Hai District), Yellow-footed gecko (*Cnemaspis aurantiacopes*) described in 2007 from Hon Dat mountain (Hon Dat District), Gecko Eisenmani (*Cyrtodactylus eisenmani*) described in 2008 in Hon Son island (Kien Hai District) and Hon Son snake (*Cryptelythrops honsonensis*) described in 2008 in Hon Son Island (Kien Hai Island). These species are endemic to KGBSR and are not found else where in the World.

Out of 26 species of conservation priority, 8 species are of special conservation priority including King cobra *Ophiophagus hannah*, turtles *Heosemys annandalii*, *Cuora amboinensis*, *Malayemys subtrijuga*, *Amysda cartilaginea*, seaturtles *Chelonia mydas* and *Eresmochelys imbricata*. These species are highly threatened nationally and globally; occur mainly in several provinces of South Vietnam and have number rapidly reduced during recent years. Within these species, 3 species *Heosemys annandalii*, *Cuora amboinensis* and *Malayemys subtrijuga* remain relatively common in KGBSR

6.2. ASSESSMENT BY SITES

Highest number of recorded species is in Phu Quoc NP with 72 species, accounting for 69.23 % of total species number of KGBSR, then follows Kien Luong – Kien Hai area with 59 species (54%) and lowest is in UMT-AB-AM area with 45 species (42.30%). This difference in species number is because of the difference in habitat types and habitat diversity (more diversity in Phu Quoc area and Kien Luong – Kien Hai area) and also survey level (less in Kien Luong – Kien Hai area).

6.2.1. Phu Quoc area

Due to high habitat diversity, Phu Quoc area contains high number of species recorded, 72 species, accounting for 69.2% total species number recorded in KGBSR: 17 amphibian species and 55 reptile species. This is not exhausted list, further surveys will add many more species to this list. Out of 72 recorded species, 23 species are of conservation priority (enlisted in RDB VN, 2007 and IUCN RL 2009). Species of special conservation priority are Python *Python reticulatus*, King cobra *Ophiophagus hannah*, turtles *Heosemys annandalii*, *Malayemys subtrijuga*, *Amysda cartilaginea*, *Chelonia mydas* and *Eresmochelys imbricata*. Moreover, 2 lizard species *Leiolepis reevesii* and *Acanthosaura capra* found in Chai village, Phu Quoc Island are not found else where.

6.2.2. UMT-AB-AM area

This area was surveyed much better than other areas of KGBSR, however, due to less habitat diversity and small area, number of recorded species is lower than in two other surveyed areas. Totally, 7 amphibian species and 38 reptile species were recorded in UMT-AB-AM area. It is worth to mention that density and number of many species, including some endangered species in this area are much higher than those in other areas. This makes this area important for conservation of these species.

6.2.3. Kien Luong – Kien Hai area

This area has unique topographic features in KGBSR by ecosystem and habitat diversity (mountain forest, limestone forests, fresh water wetlands, mangrove forest, island ecosystems, etc.). This implicates high biodiversity of Herpetofauna. One evidence of this is recent discovery of 3 species new for science including White-tailed gecko *Cnemaspis caudanivea*, Eisenmani lizard *Cyrtodactylus eisenmani* and Hon son viper *Cryptelythrops honsonensis*. Unfortunately, herpetofauna in this area is poorly studied. So far, only 13 amphibian species and 46 reptile species were found. Further studies certainly will record many more species for this area, possibly also species new for science. Out of 59 recorded species, 20 species are threatened nationally and globally.

6.3. THREATS TO HERPETOFAUNA IN KGBSR

a) *Wildlife hunting and trade*: The most direct and serious threats to herpetofauna is hunting for different purposes:

- as food for households or in eating shops / restaurants
- as traditional medicines (making tonic liquor, balms, raw animal part such as python gall bladder, snake penis, varanus hands, etc.)
- as decorative purpose: dry stuffs, dry animals, production of souvenir goods
- as trade of live animals to big cities

We visited some wildlife shops in local markets and found 26 species were for sale (Table 20).

Table 20. Species in trade found in local markets in KGBSR

No	Vietnamese name	Scientific name	Local name	Types of trade
1	Rồng đất	<i>Physignathus cocincinus</i>	Kỳ tôm, càng tôm	Live animals
2	Thằn lằn bay đốm	<i>Draco maculatus</i>		Alcohol liquor, dry animals
3	Tắc kè	<i>Gecko gecko</i>	Tắc kè	Alcohol liquor, dry animals
4	Kỳ đà vân	<i>Varanus nebulosus</i>	Càng cuốc	Live animal
5	Kỳ đà hoa	<i>Varanus salvator</i>	Kỳ đà	Live animal
6	Rắn hai đầu	<i>Cylindrophis ruffus</i>	Rắn trun	Live animal
7	Trăn đất	<i>Python molurus</i>	nưa	Meat and live animal
8	Trăn gấm	<i>Python reticulatus</i>	Trăn	Meat and live animal
9	Rắn móng	<i>Xenopeltis unicolor</i>	Hổ hành	Live animal
10	Rắn sọc dưa	<i>Coelognathus radiata</i>	Hổ ngựa	Alcohol liquor and live animal
11	Rắn ráo	<i>Ptyas korros</i>	Rắn lái	Alcohol liquor and live animal
12	Rắn ráo trâu	<i>Ptyas mucosus</i>	Hổ hèo	Alcohol liquor and live animal

13	Rắn bồng voi	<i>Enhydris bocourti</i>	Ri tượng, ri voi	Live animal
14	Rắn bồng súng	<i>Enhydris enhydris</i>		Live animal
15	Rắn bồng không tên	<i>Enhydris innominata</i>	Hồ lác, hồ sậy	Live animal
16	Rắn bồng chì	<i>Enhydris plumbea</i>		Live animal
17	Rắn râu	<i>Erpeton tentaculatum</i>		Live animal
18	Rắn ri cá	<i>Homalopsis buccata</i>		Live animal
19	Rắn nước	<i>Xenochrophis flavipunctatus</i>		Live animal
20	Rắn cạp nong	<i>Bungarus fasciatus</i>	Mai gầm	Alcohol liquor and live animal
21	Rắn hổ mang kau thia	<i>Naja kaouthia</i>	Hồ đát	Alcohol liquor and live animal
22	Rùa hộp lưng đen	<i>Cuora amboinensis</i>	Rùa nắp	Live animal
23	Rùa răng	<i>Heosemys annandalii</i>	Càng đước	Live animal
24	Rùa đất lớn	<i>Heosemys grandis</i>		Live animal
25	Rùa ba гор	<i>Malayemys subtrijuga</i>	Rùa yếm vàng	Live animal
26	Đồi mồi	<i>Eremochelys imbricata</i>		Dry shell and processed products

b) *Reduction of habitats:* Habitats of many species is reduced due to encroachment of agriculture lands, aquaculture, road building, industrial development (Cement factory, Stone exploitation), tourism facilities construction (Phu Quoc, Chua Hang and Ha Tien areas) and new settlement areas (Kien Luong District), etc.

c) *Living environmental quality degradation:* due to harvesting of forest products (timber, rattans, etc.), forest fire, subsistence wastes of local residents and tourists, etc. These cause great negative impacts on living environment of wildlife in general and herpetofauna in particular.

Ha Tien Ciment Factory

Photo: Ngô Xuân Tường

Figure 16. Cement factory cause loss of limestone habitats and environmental pollution

d) Low conservation awareness: Local residents' livelihood mainly depends on harvesting natural aquatic and forest products, including many herpetological species. Their awareness about nature protection and wildlife conservation is still low.

e) Effect of forest management is not high. Evidence of this is that wild animals, including rare and threatened species are commonly hunted and traded in the local markets (An Binh, Minh Thuan, etc.)

SHORTLY, although preliminary, this assessment shows high potential biodiversity of herpetofauna in KGBSR. Up to now, 107 species of amphibians and reptiles were recorded in KGBSR with 5 species typical for Mekong Delta fauna. Further studies of both herpetofauna and habitats are necessary to get better understanding of this unique fauna. Out of 107 recorded species, 4 species are possibly extinct from the wild, 2 species are not found else where in Vietnam, 25 species enlisted in RDB VN, 2007 and 13 species enlisted in IUCN RL, 2009. Wildlife hunting, trade and habitat degradation are most serious threats to herpetofauna in KGBSR.

CHAPTER 7. CONCLUSION AND RECOMENDATION

7.1. CONCLUSION

KGBSR contains very high biodiversity values, though studied are not sufficient. Up to now, it was recorded in KGBSR:

- 6 main ecosystems with 22 different habitat types
- About 1.500 species of vascular plants from 150 families and 70 orders
- 77 species of mammals belonging to 20 families, 8 orders
- 222 species of birds belonging to 50 families, 11 orders
- 107 species of reptiles and amphibians belonging to 20 families, 5 orders

Within recorded species, 30 plant species, 20 mammal species, 19 bird species, 1 amphibian species and 26 reptile species are threatened with extinction in Vietnam and/or in the World. There are 20 species of special conservation priority including Roundleaf Cycad *Cycas litoralis*; Hairy-nosed Otter *Lutra sumatrana*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Indochinese Silver Langur *Trachypithecus germaini*, Lylei's Fruit Bat *Pteropus lylei*, Large Flying Fox *Pteropus vampyrus*; Sarus Crane *Grus antigone*, Indian Darter *Anhinga melanogaster*, Lesser Adjutant *Leptoptilos javanicus*, Great Hornbill *Buceros bicornis*; Reticulated Python *Python reticulatus*, King cobra *Ophiophagus hannah*, Yellow-headed Temple Turtle *Heosemys annandalii*, Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*; Green Sea Turtle *Chelonia mydas* and Hawksbill Sea Turtle *Eretmochelys imbricata*.

Four (4) forest types and/or plant stand are of special conservation priority:

- Dwarf forest on sand hill in Phu Quoc NP
- Stand of *Lumnitzera littorea* in Rach Tram estuary, Phu Quoc NP.
- Natural *Melaleuca* forest on pit in UMT NP
- Coastal mangrove forest

Main forest management problems and threats to biodiversity are:

- Maintaining of high water level for forest fire prevention is causing negative impact on growth and development of *Melaleuca* forests.
- Conversion of forestry land with rare vegetation types in Phu Quoc NP into land for tourism infrastructure construction,...
- System of dykes surrounding household forest is disturbing dispersal and natural regeneration of coastal mangrove forests
- Existing encroachment/destruction of coastal protection forest for aquaculture.
- Widespread wildlife hunting and trade
- Human encroachment and disturbance of wildlife habitat
- Environment pollution due to subsistence and industrial wastes and use of pesticides and herbicides
- Impacts of economic and tourism development leading to reduction of forest area and habitat degradation.
- Local community has low awareness on biodiversity conservation.
- Low effect of forest and wildlife management in the area

7.2. RECOMMENDATIONS

7.2.1. Additional biodiversity surveys for kgbsr

1. Additional biodiversity assessment of Hon Chong NR and coastal islands in Kien Luong – Kien Hai (2010)

Kien Luong – Kien Hai area represents a unique landscape. Tropical broadleaf forests in Hon Chong Semi-island (and also small islands) contain high biodiversity potential, but still poorly investigated. Many species that are new for science have discovered during recent years. This area is facing with increasing negative impacts from industrial development (Cement factory, future thermo-electricity factory, future sea port development, etc.) and tourism development. The biodiversity values of this area should be properly assessed for relevant conservation measures

2. Survey for assessing population status of species conservation priority species (2010-2011).

Additional surveys are necessary to identify population status of highly endangered species such as Indochinese Silver Langur *Trachypithecus germaini*, Long-Tailed Macaque *Macaca fascicularis*, Slow Loris *Nycticebus coucang*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Hairy-nosed Otter *Lutra sumatrana*, Small-clawed Otter *Aonyx cinerea*, Sarus Crane *Grus antigone*, Indian Darter *Anhinga melanogaster*, Lesser Adjutant *Leptoptilos javanicus* Yellow-headed Temple Turtle *Heosemys annandalii*, Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*, Green Sea Turtle *Chelonia mydas*, and Hawksbill Sea Turtle *Eretmochelys imbricata* and also Lylei's Fruit Bat *Pteropus lylei*, Large Flying Fox *Pteropus vampyrus* in Phu Quoc NP, UMT NP, Hon Chong NR. These animals are strongly facing with various negative impacts (hunting, habitat degradation, infrastructural development, etc.)

To implement a further study for stand of *Lumnitzera littorea* in Rach Tram estuary of Phu Quoc NP to identify its regeneration capacity and ecological requirement for applying relevant conservation measures.

3. Survey of wildlife trade in KGSR area (2010)

To carry out a survey of wildlife hunting, trade and wildlife keeping in area of Phu Quoc NP, UMT NP, Hon Chong NR (Kien Luong District) to identify scale, network, dynamic of wildlife trade, participating people, importance of wildlife trade for livelihood of poor families, etc. in order to develop relevant measures for its control

4. Study of restoration and sustainable development of Melaleuca forests (2010-2012).

Study is necessary to identify environmental conditions for natural regeneration of *Melaleuca* forest and develop technical guidance for natural regeneration of *Melaleuca* forest in UMT NR, forest compartment 2 of AB-AM Protection Forest.

To assess impacts of long-term retaining of high water level for fire prevention on growth and development of *Melaleuca* forests in UMT NP and forest compartments 1 and 3 of AB-AM Protection Forest in order to determine relevant hydrological regime that can help to minimize risk of forest fire meanwhile support the normal development of *Melaleuca* forest

5. Study of disposal capacity and natural sea-encroachment capacity of mangrove forests (2011- 2013)

System of dykes for aquaculture and harvesting natural sea products is disturbing the natural dispersal and natural regeneration of mangrove forest trees (*Rhizophora spp*; *Bruguiera spp*; *Avicennia spp.*; *Aegiceras sp.*; *Sonneratia spp.*) that reduce sea-encroachment and environmental protection function of the forest. Study of dispersal capacity, natural regeneration capacity of forest will help to find the measures for less expensive development of coastal mangrove forests that reflects natural forest processes/succession.

6. Investigation for developing vegetation map, soil map and hydrological map of UMT NP (2010-2011)

These maps together with companying data set will be an important scientific database for development of relevant management measures and monitoring of change in vegetation cover of UMT NP.

7. Environmental impact assessment of development projects inside and in vicinity of KGBSR (since 2010).

To conduct environmental impact assessment of Starbay Tourism Landscape Project (542.79 ha) and another proposed tourism project in Phu Quoc NP for reviewing these projects to meet biodiversity conservation purposes in this area .

To conduct environmental impact assessment of development projects in Kien Luong district close to Hon Chong NR and Kien Luong-Kien Hai Protection Forest such as Thermo-electric factory construction, Cement factory construction, new harbor construction and tourism development for mitigation measures

To conduct environmental impact assessment of aquaculture system inside protection forest to find measures for mitigating negative impacts and ensuring sustainable development in the area.

7.2.2. Biodiversity monitoring and evaluation programme

1. Monitoring of populations of high conservation priority species (since 2010).

Population status of following highly endangered species should be monitored for relevant conservation measures: Indochinese Silver Langur *Trachypithecus germaini*, Long-Tailed Macaque *Macaca fascicularis*, Slow loris *Nycticebus coucang*, Jungle Cat *Felis chaus*, Fishing Cat *Prionailurus viverrinus*, Large-spotted Civet *Viverra megaspila*, Hairy-nosed Otter *Lutra sumatrana*, Small-clawed Otter *Aonyx cinerea*, Sarus Crane *Grus antigone*, Lesser Adjutant *Leptoptilos javanicus*, Indian Darter *Anhinga melanogaster*, Yellow-headed Temple Turtle *Heosemys annandalii*,

Malayan Box Turtle *Cuora amboinensis*, Snail-eating Turtle *Malayemys subtrijuga*, Asiatic Softshell Turtle *Amyda cartilaginea*, Green Sea Turtle *Chelonia mydas*, and Hawksbill Sea Turtle *Eretmochelys imbricata* in Phu Quoc NP, UMT NP and Hon Chong NR and also populations of Lylei's Fruit Bat *Pteropus lylei*, Large Flying Fox *Pteropus vampyrus* in Phu Quoc NP and UMT NP.

2. Monitoring forest area reduction due to negative impacts of human activities (since 2010)

Coastal Protection forests represent as narrow strip along sea coast and always face with forest encroachment/destruction by aquaculture and other human activities, therefore, long-term monitoring program must be set up in critical areas for monitoring the change and apply relevant mitigation measures. Remote sensing techniques (satellite images) should be applied for large-scale forest area monitoring.

3. Monitoring factors that cause degradation of environment quality and wildlife habitats (since 2010).

Negative impacts on environment and habitats causing by tourism development, pollution by subsistence wastes, industrial wastes, use of pesticides, herbicides, rodent poisonous baits, etc should be monitored to undertake relevant prevention and mitigation measures.

7.2.3. Forest protection programme

*1. Capacity building for Management Boards of Nature Reserves and Protection Forests
(2010 – 2012)*

Conducting various training courses for staff members of the forest management boards to increase their knowledge on biodiversity conservation, techniques of biodiversity monitoring and evaluation, their skill of key species identification, observation, recording and reporting, etc.

Conducting training courses to improve the knowledge and enforcement skill of national legislation on forest protection and wildlife conservation

Constructing additional guard posts in Hon Chong NR and Kien Luong – Kien Hai Protection forest to improve effectiveness of the forest protection.

Providing the forest management boards with equipments for forest patrol, law enforcement and forest fire prevention such as motorcycles, motorboats, car, GPS, binocular, etc.)

2. Intensification of forest patrolling and law enforcement (since 2010)

Intensification of forest patrolling and law enforcement to control:

- illegal forest encroachment/destruction
- wildlife hunting, trade and consumption in the area

- wildlife keeping and husbandry in the area to prevent catching animals from the wild for captive breeding stock as well as smuggling wild-caught animals under the guide of captive breeding of wild animals

3. Installing system of signboards with notification about boundaries and management regulations of KGBSR (2010).

Signboards notifying KGBSR boundary and management regulations are necessary to keep local people and visitors (tourists) aware and obey management regulations of KGBSR in terms of nature protection, forest protection and wildlife conservation.

*4. Conservation of stand of *Lumnitzera littorea* and unique vegetation type "Dwarf forest on sand hills" in Phu Quoc NP (since 2010)*

Plant species *Lumnitzera littorea* is classified as VU-vulnerable in RDB VN (2007) and stand of *Lumnitzera littorea* in Phu Quoc NP is the largest population of this species in Vietnam. It must be strictly protected for its long-term survival.

"Dwarf forest on sand hills" in Phu Quoc NP (located from Ganh Giau Guard Post to Bai Can Guard Post) is very rare vegetation type in Vietnam. This vegetation type has long history of adaptation to high salinity, acid and inundation. This vegetation type usually has small size and therefore highly sensitive to human impact. It will not be recovered if it is undergone of destruction.

5. Development of community-based forest management model (since 2011)

Establishment of community-based forest management model is important to reduce pressure on biodiversity and improvement of livelihood of local communities. Objectives of this models include:

- Participatory reforestation, forest protection and enrichment of existing forests for sea wave prevention, environmental protection and biodiversity conservation.
- Developing and applying system of sustainable use of forest resources and forest land by local community
- Increase forest products from Production forests including timbers, fuelwood, livestock food and other non-timber forest products to increase household income of local communities.
- Involvement of local households into planning and management of forest products.

7.2.4. Conservation education and improvement of livelihood for local communities

1. Conducting educational programme to increase awareness of local communities on nature protection and biodiversity conservation (since 2010).

Some key activities are:

- Producing brochure about KGBSR
- Producing manuals for education on forest protection and biodiversity conservation and conducting training courses for local communities and schools.

- Producing and distributing posters, leaflet with messages on nature protection and biodiversity conservation.
- Conducting educational programmes by public media such as newspapers, radio and TV broadcasting, etc.

2. Conducting programmes that help to improve livelihood of local communities, involving of the local community in forest management activities so that they can receive certain benefits from forests; introducing alternative materials for forest products to reduce pressure on local forests (since 2010).

Following activities can be carried:

- Providing local community with credit for production development, introducing advanced technologies for increasing productivity of agricultivation, animal husbandry, development of traditional industries or applying new industries to create new job and new income sources for local communities.
- Conducting forest allocation for protection to local communities
- Introducing alternative materials for timber, fuelwood and other non-timber forest products.
- Contracting local people for forest growing and forest protection
- Involving local communities into tourism services that will create additional household income

ANNEX 6B : DISTTIBUTION OF BIRDS BY HABITAT TYPES

1 – Mountain preliminary and secondary forest; 2 – Coastal mangrove forest; 3 – Melaleuca forest; 4 – Grassland on dykes; 5 – Openland (open wetland, agriculture land, meadows, etc.)

No	Scientific name	Vietnamese name	PQ	UMT-AB-AM	KL-KH
	I. ANSERIFORMES	BỘ NGÔNG			
	1. Dendrocygnidae	Họ Lê			
1	<i>Dendrocygna javanica</i>	Le nâu	2,5	3,5	2,5
	2. Anatidae	Họ Vịt			
2	<i>Anas penelope</i>	Vịt đầu vàng		5	
3	<i>Anas poecilorhyncha</i>	Vịt trời		5	5
4	<i>Anas querquedula</i>	Mồng két mày trắng	2,5	5	
	3. Turnicidae	Họ Cun cút			
5	<i>Turnix suscitator</i>	Cun cút lưng nâu	1		
	II. PICIFORMES	BỘ GỖ KIỀN			
	4. Picidae	Họ Gỗ kiền			
6	<i>Picumnus innominatus</i>	Gỗ kiền lùn đầu vàng	1,3		
7	<i>Dendrocopos canicapillus</i>	Gỗ kiền nhỏ đầu xám	1,3		
8	<i>Picus sp.</i>	Gỗ kiền xanh?	1		
9	<i>Chrysocolaptes lucidus</i>	Gỗ kiền vàng lớn	1		
	5. Megalaimidae	Họ Cu rốc			
10	<i>Megalaima lineata</i>	Thày chùa bụng nâu	1,3		
11	<i>Megalaima faiosticta</i>	Thày chùa đầu xám	1,3		
12	<i>Megalaima australis</i>	Cu rốc đầu đen	1,3		
	III. BUCEROTIFORMES	BỘ HỒNG HOÀNG			
	6. Bucerotidae	Họ Hồng hoàng			
13	<i>Anthracoceros albirostris</i>	Cao cát bụng trắng	1		
14	<i>Buceros bicornis</i>	Hồng hoàng	1		
	IV. CORACIFORMES	BỘ SÀ			
	7. Coraciidae	Họ Sà rừng			
15	<i>Coracias benghalensis</i>	Sà rừng	1,2,3	2,3,4	1,2
16	<i>Eurystomus orientalis</i>	Yến quạ	1		
	8. Alcedinidae	Họ Bồng chanh			
17	<i>Alcedo atthis</i>	Bồng chanh	2	3,4,5	2,5
	9. Halcyonidae	Họ Sà			
18	<i>Halcyon capensis</i>	Sà mỏ rộng	2,3,5	2,3,4	2,5
19	<i>Halcyon smyrnensis</i>	Sà đầu nâu	2,3,5	2,3,4	2,5
20	<i>Halcyon pileata</i>	Sà đầu đen	2,5	2,3,5	
21	<i>Todiramphus chloris</i>	Sà khoang cổ	2,3,5	2,3,4,5	2,5
	10. Cerylidae	Họ Bói cá			
?	<i>Ceryle rudis</i>	Bói cá nhỏ	2,5		
	11. Meropidae	Họ Trâu			
23	<i>Merops orientalis</i>	Trâu đầu hung		2,3	2,5
24	<i>Merops superciliosus</i>	Trâu ngực nâu	2,5	2,3,4,5	2,5
25	<i>Merops leschenaulti</i>	Trâu họng vàng	2,5		
	V. CUCULIFORMES	BỘ CU CU			
	12. Cuculidae	Họ Cu cu			
26	<i>Hierococcyx sparverioides</i>	Chèo cheo lớn		3	
27	<i>Hierococcyx fugax</i>	Chèo cheo nhỏ		3	
28	<i>Cuculus micropterus</i>	Bắt cô trói cột		2,3	

No	Scientific name	Vietnamese name	PQ	UMT-AB-AM	KL-KH
